FDOT - DISTRICT 1
Signal Timing Report
 (For isolated traffic signal)

Drawn By:	RC
Date:	10/20/15
Checked By:	EMC
Date:	10/20/15

Approved By:	
Rovindra Churaman, P.E. # 73829	
Date:	11.12.2015

Revisions	Location Details	
03/2015: Updated the controller timing parameters to June 2014 Guidelines. Added detection delay for minor street right turn movements.	Section: 13030	Mile Post: 4.789
	Major Street: US 41	Orientation: N-S
	Minor Street: 73rd St E/69th St E	Orientation: E-W
	Sig ID: 433	
	Implemented: 06.25.2015	

Disclaimer Statement

The revisions noted above are the only timing parameters being approved. The remaining timing data was previously approved as part of previous revisions or as part of previous retiming efforts.

Ring - 2	5	6	8	7

- Notes:
- 1) Use 'Max 1' during FREE operation and 'Inhibit Max' during coordination
 - 2) Use Floating Force Offs
 - 3) Sequence 1 used during FREE operation
 - 4) Max recall phases 2 & 6 during coordination. Min recall phases 2 & 6 during pattern 8 only
 - 5) Program 8 Seconds detection delay for minor street right turn movements.
 - 6) Controller Brand: Naztec Controller Model: 980
 - 6.a) Program 'MinPerm' for pedestrian phases during coordination
 - 6.b) Enable 'Stop In Walk' during coordination.
 - 6.c) Program 'Return Hold' during coordination
 - 6.d) Short/Long percentage is 10/22 for all patterns
 - 6.e) Program Walk Recycle, "3478_INH" during coordination

- 6.f) Signal is in FREE operation during pattern 8 with 'Max' intervals indicated in 'splits' for pattern 8. 'Cycle Length', 'Offset' and 'Coord Phase' not to be programmed for pattern 8.
- 7) OL-B (NBR) = 4+5 with Min Green = 5 sec, Yellow = 3.7 sec and All Red = 3.4 sec
- 8) OL-B to be programmed as Min Green type overlap

Signal Timing Report
 (For isolated traffic signal)

Drawn By:	EME
Date:	02/2017
Checked By:	RJ
Date:	06/2017

Printed Copies of this document are not considered signed and sealed. The signature must be verified on the electronic document

This document has been digitally signed and sealed by: Renjan Joseph, P.E. # 68284

Revisions	Location Details	
02/2017: New signal. Adjusted Yellow, All Red, Walk, Flashing Don't Walk and Max I times. Adjusted phases 2 & 6 Ext. Adjusted phases 1, 3, 5 & 7 Min Green. Adjusted Preemption sequences to match field installation.	Section: 17005	Mile Post: 2.716
	Major Street: SR 681	Orientation: E-W (Considered)
	Minor Street: Honore Ave.	Orientation: N-S (Considered)
	Sig ID: 1115	
	Implemented: 5/9/2016	

Disclaimer Statement

The revisions noted above are the only timing parameters being approved. The remaining timing data was previously approved as part of previous revisions or as part of previous retiming efforts.

VEHICLE OVERLAP PHASES

OLA COMES UP WITH MOVEMENTS 1, 2, & 4 WITH MIN GREEN = 7 SECS., YELLOW= 4 SECS., ALL RED= 6.1 SECS.
 OLB COMES UP WITH MOVEMENTS 2, 3, & 4 WITH MIN GREEN = 7 SECS., YELLOW= 4 SECS., ALL RED= 6.8 SECS.
 OLC COMES UP WITH MOVEMENTS 1, 2, & 4 WITH MIN GREEN = 7 SECS., YELLOW= 4 SECS., ALL RED= 2 SECS.
 OLD COMES UP WITH MOVEMENTS 2, 3, & 4 WITH MIN GREEN = 7 SECS., YELLOW= 4 SECS., ALL RED= 2 SECS.
 OLE COMES UP WITH MOVEMENT 1 WITH MIN GREEN= 7 SECS., YELLOW= 4 SECS., ALL RED= 2 SECS.
 OLF COMES UP WITH MOVEMENT 3 WITH MIN GREEN = 7 SECS., YELLOW= 4 SECS., ALL RED= 2 SECS.

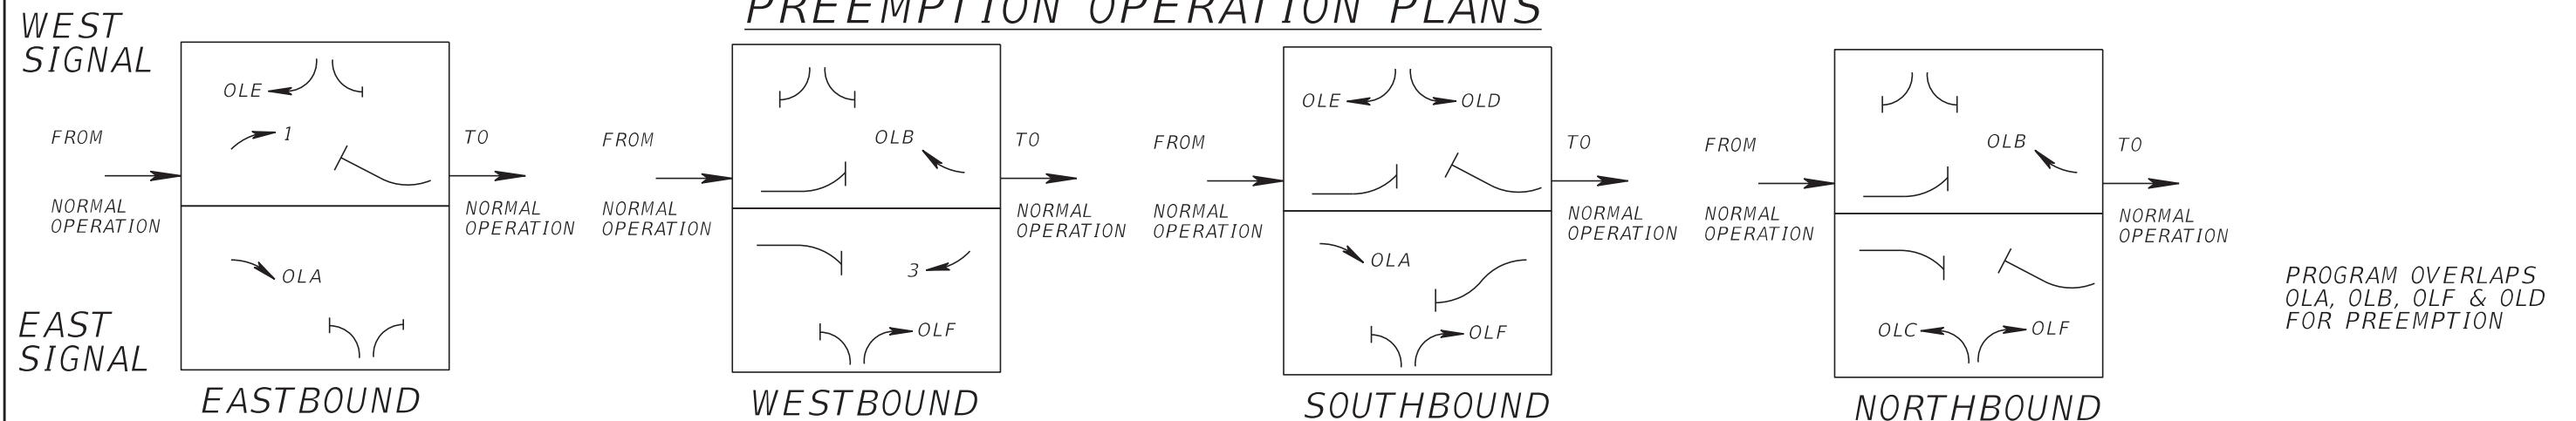

CONTROLLER OPERATION NOTES

- CONTROLLER PHASE 2 HAS NO OUTPUT INDICATION AND IS THE PARENT MOVEMENT FOR OLD (DETECTION TO BE ASSIGNED TO CONTROLLER PHASE 2 AND SIGNAL HEADS TO BE WIRED TO OLD.)
- CONTROLLER PHASE 4 HAS NO OUTPUT INDICATION AND IS THE PARENT MOVEMENT FOR OLC (DETECTION TO BE ASSIGNED TO CONTROLLER PHASE 4 AND SIGNAL HEADS TO BE WIRED TO OLC.)
- ASSIGN VEHICLE DETECTION FROM D2-OLE TO MOVEMENT 1.
- ASSIGN VEHICLE DETECTION FROM D2-OLF TO MOVEMENT 3.
- AT LEAST THREE (3) WEEKS PRIOR TO TIMING IMPLEMENTATION AND PROGRAMMING OF THE CONTROLLER, REQUEST UPDATED SIGNAL TIMINGS (BASIC CONTROLLER AS WELL AS COORDINATION) FROM FDOT TRAFFIC SIGNAL SYSTEM MANAGER (863-519-2746). PROVIDE FDOT WITH ALL 'AS-BUILT' INFORMATION NECESSARY TO DEVELOP THE BASIC SIGNAL TIMING PARAMETERS. PROGRAM THE CONTROLLER AS PER THE TIMINGS PROVIDED BY FDOT.

Historical Crash Analysis

SAFETY MEMORANDUM

Moccasin Wallow Road at I-75

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes Moccasin Wallow Road from Gateway Boulevard to 71st Avenue East and I-75 from south of Moccasin Wallow Road to north of Moccasin Wallow Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 100 crashes involving 158 vehicles occurred during the analysis period resulting in four fatalities and 65 injuries. This crash data is included in **Appendix F**. Crashes were closely split between northbound I-75 and southbound I-75. Northbound I-75 accounted for 38 crashes, 62 vehicles, two fatalities, and 24 injuries. Southbound I-75 accounted for 38 crashes, 55 vehicles, one fatality, and 10 injuries. Both the Moccasin Wallow Road and I-75 witnessed a fluctuating number of crashes, but no remarkable increasing or decreasing from 2013 to 2017.

Table 1: Crash History by Roadway and Year

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. These locations include the ramp segments connecting I-75 to the Moccasin Wallow Road. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. The areas of highest crash frequency are southbound I-75 at the on-ramp from Moccasin Wallow Road, northbound I-75 at off-ramp to Moccasin Wallow Road, and Moccasin Wallow Road at Buffalo Road. There is also a cluster of crashes between the ramp terminals on southbound I-75.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Gateway Blvd to Gillet Dr	0	4,100	0.205	0.000	1.730	0	0.00%
Gillet Dr to I-75 SB Ramp Terminal	6	4,100	0.146	5.492	1.730	1.2	74.25%
I-75 SB to NB Ramp Terminals	0	10,000	0.082	0.000	1.730	0	0.00%
I-75 NB Ramp Terminal to Buffalo Rd	0	10,000	0.230	0.000	1.730	0	0.00%
Buffalo Rd to 71st Ave E	0	10,000	0.249	0.000	3.589	0	0.00%

* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

Ran Off Road	0	1	0	0	0	1	0.2	1.0%
Rear End	0	7	4	0	4	15	3.0	15.0%
Right Turn	0	0	0	0	1	1	0.2	1.0%
Sideswipe	2	1	1	6	2	12	2.4	12.0%
Single Vehicle	1	0	3	1	2	7	1.4	7.0%
Unknown	0	0	0	0	0	0	0.0	0.0%
Total	15	23	22	22	18	100	20.0	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Hit fixed object and left turn crashes were the most common on arterial segments. Left turn crashes were the most common at arterial intersections. With regards to interstate segments, hit fixed object crashes were most common. The Highway Safety Manual (HSM) indicates that possible contributing factors for hit fixed object crashes include:

- Obstruction in or near roadway
- Inadequate lighting
- Inadequate pavement markings
- Inadequate signs, delineators, or guardrail
- Slippery pavement
- Roadside Design
- Inadequate roadway geometry
- Excessive speed

Possible contributing factors for left turn crashes include:

- Misjudge speed of on-coming traffic
- Pedestrian or bicycle conflicts
- Inadequate signal timing
- Inadequate sight distance

Figure 4 shows a map of crash locations by crash type. Any head on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (73.0 percent) with non-rainy weather (76.0 percent) and dry roads (66.0 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Surface Condition								
Dry	10	12	16	17	11	66	13.2	66.0%

Total	15	23	22	22	18	100	20.0	100.0%

There are no locations in the study area with 30 or more crashes. Due to the small sample size of crashes at the location level, a breakdown of roadway and lighting conditions by location is not provided.

2.4 Crash Severity

Table 11 summarizes crashes for the study area by severity. Of the 100 total crashes, there were four fatal crashes, 36 crashes involving personal injury, and 60 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 12**.

Table 11: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	1	3	0	4	0.8	4.0%
Severe Injury	2	1	4	3	2	12	2.4	12.0%
Moderate Injury	4	0	3	1	1	9	1.8	9.0%
Minor Injury	0	7	2	4	2	15	3.0	15.0%
Property Damage Only	9	15	12	11	13	60	12.0	60.0%
Total	15	23	22	22	18	100	20.0	100.0%

Table 12: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 13, **Table 14**, and **Table 15** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were four fatal crashes, 12 severe injury crashes, nine moderate injury crashes, 15 minor injury crashes, and 60 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$56,772,731, which is an average of \$11,354,546 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, five locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was northbound I-75 at off-ramp to Moccasin Wallow Road, with an estimated total five-year crash cost of \$13,182,005. The location with the highest average cost per crash was Moccasin Wallow Road at I-75 northbound ramp terminal, with an average cost per crash of \$10,670,000.

Table 13: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Gillet Dr to I-75 SB Ramp Terminal	0	0	1	1	4	6	\$311,033	\$51,839	\$225,315

SAFETY MEMORANDUM

I-275 at I-75

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes the south portion of I-275 in the vicinity of its connection to I-75 and I-75 in the vicinity of its connection to I-275. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into segment locations. On each interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 142 crashes involving 236 vehicles occurred during the analysis period resulting in two fatalities and 79 injuries. This crash data is included in **Appendix F**. Crashes were closely split among northbound I-75 and southbound I-75. Northbound I-75 accounted for 49 crashes, 83 vehicles, one fatality, and 19 injuries. Southbound I-75 accounted for 47 crashes, 80 vehicles, zero fatalities, and 34 injuries. Crash frequency along northbound I-275 increased gradually from 2013 through 2016 and remained at a close level from 2016 to 2017. Comparing with the crash frequency in 2013, southbound I-75 has a much higher crash frequency after 2014 (about 10 crashes per year). Other locations show a generally constant crash frequency.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries
NB I-275 Mainline Segments				
2013	3	4	0	0

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual. The procedure was used to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for the location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2 and **Table 3** summarize the crash rates for the I-275 segments and I-75 segments respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 4**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the three ramp segments connecting I-275 and I-75 do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

Overall, crash frequency is low in the study area. Nevertheless, a relatively large number of crashes clustered on both southbound I-75 at the on-ramp from southbound I-275 and I-75 NB at the off-ramp to I-275 NB. Additionally, crash clusters are also present on southbound I-75 just south of the off-ramp to northbound I-275 and on northbound I-75 south of the on-ramp from I-275 southbound.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: I-275 Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
NB I-275 Mainline

Table 6 and **Table 7** summarize the most frequent crash type for I-275 segments and I-75 segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Hit-fixed-object crashes were the most common on both I-275 segments and I-75 segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for hit-fixed-object crashes include:

- Obstruction in or near roadway
- Inadequate lighting
- Inadequate pavement markings
- Inadequate signs, delineators, or guardrail
- Slippery pavement
- Roadside Design
- Inadequate roadway geometry
- Excessive speed

Figure 4 shows a map of crash locations by crash type. Crash types without any associated crashes are not listed in the legend.

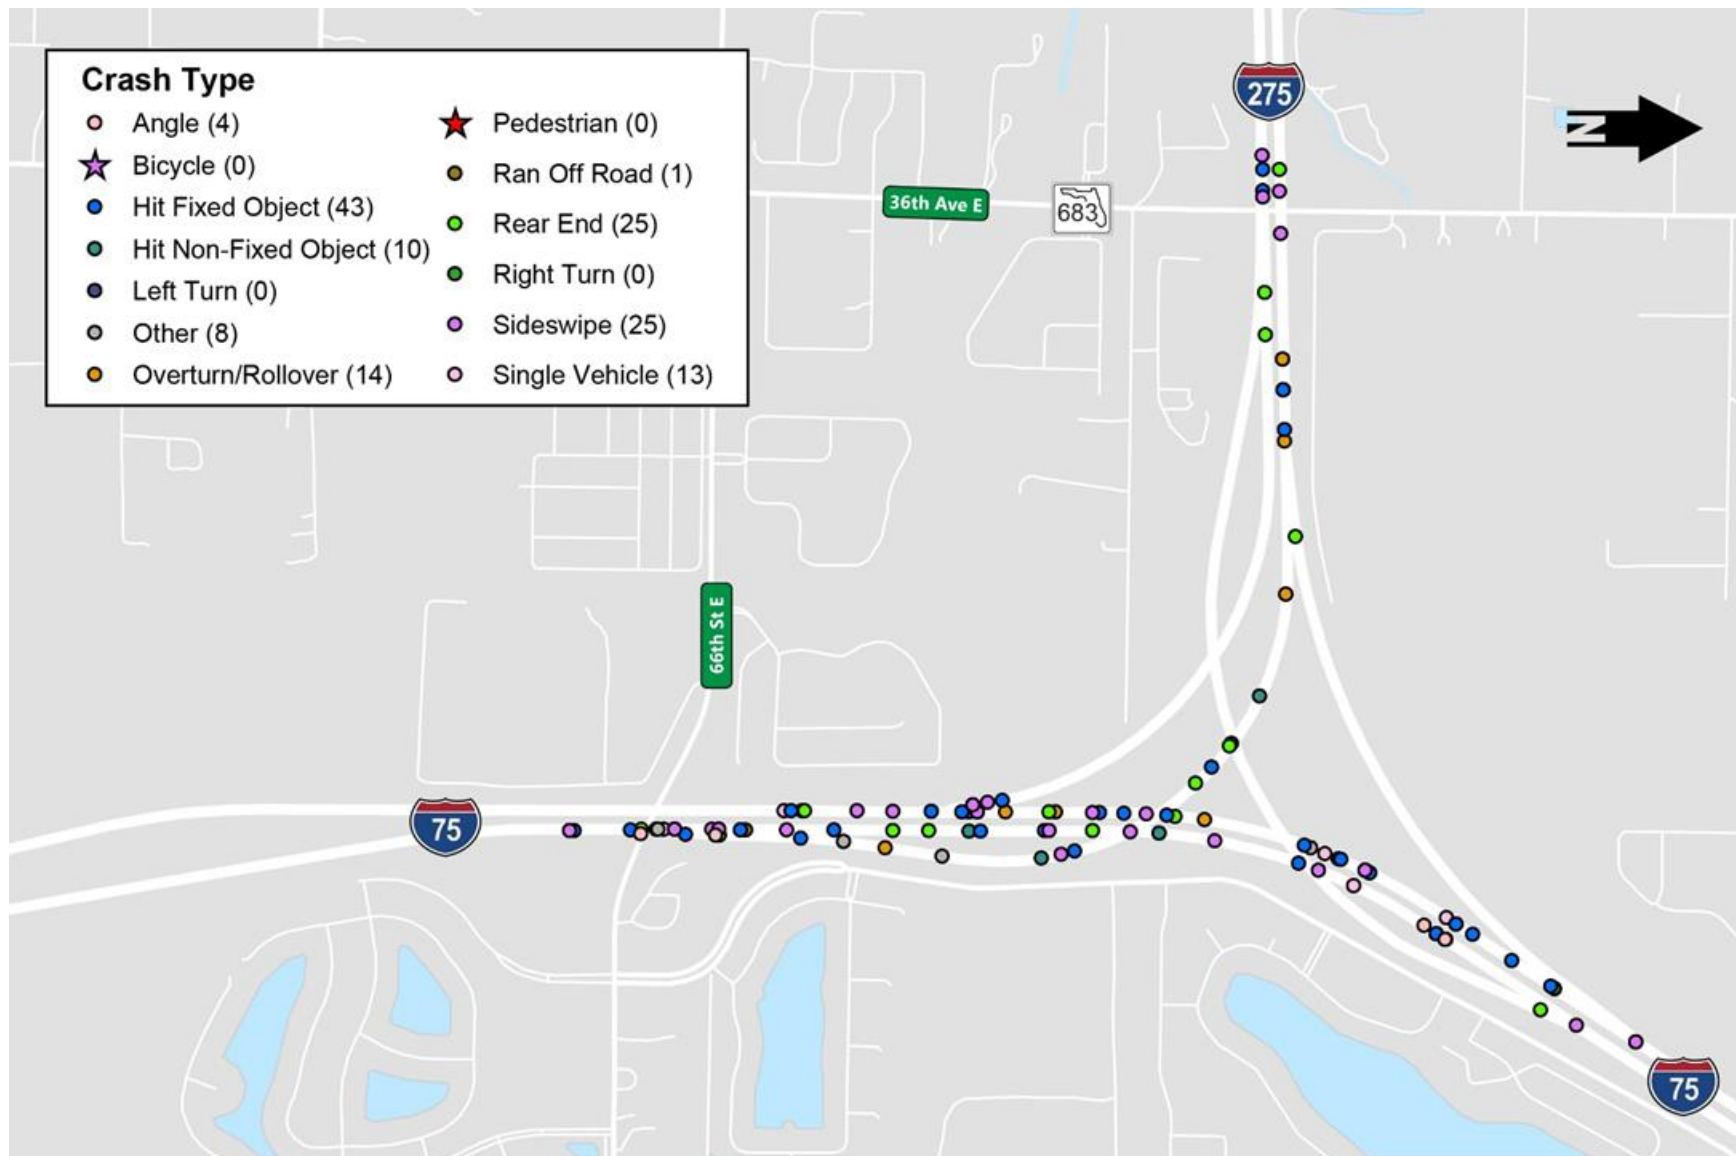

Table 6: I-275 Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
I-275 NB at I-75 NB	Hit Fixed Object Other	4	23.5%

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 8** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (72.5 percent) with non-rainy weather (75.4 percent) and dry roads (69.7 percent).

Table 7: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Surface Condition

Table 9 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Only one location has at least 30 crashes. This location is northbound I-75 at the off-ramp to northbound I-275, with a proportion of wet/slick/unpaved and standing water crashes at 23 percent and a proportion of crashes taking place in dark conditions with no lighting at 19 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in Table 10 is included in **Appendix F**.

Table 9: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %
I-75 Mainline						
I-75 NB at Off-Ramp to I-275 NB	31	7	0	23%	6	19%

2.4 Crash Severity

Table 10 summarizes crashes for the study area by severity. Of the 142 total crashes, there were two fatal crashes, 47 crashes involving personal injury, and 93 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 11**.

Table 10: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	2	0	0	0	2	0.4	1.4%
Severe Injury	1	3	3	3	3	13	2.6	9.2%
Moderate Injury	1	6	1	3	2	13	2.6	9.2%
Minor Injury	1	3	5	4	8	21	4.2	14.8%
Property Damage Only	16	14	16	24	23	93	18.6	65.5%
Total	19	28	25	34	36	142	28.4	100.0%

Table 11: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 12 and **Table 13** summarize crash severity and comprehensive crash cost by location for I-275 segments and I-75 segments, respectively. Locations without crashes are excluded from these tables. Overall, there were two fatal crashes, 13 severe injury crashes, 13 moderate injury crashes, 21 minor injury crashes, and 93 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$37,892,805, which is an average of \$7,578,561 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, six locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was I-75 NB at Off-Ramp to I-275 NB, with an estimated total five-year crash cost of \$14,388,750. The location with the highest average cost per crash was on-ramp to southbound I-75 from southbound I-275, with an average cost per crash of \$1,554,645.

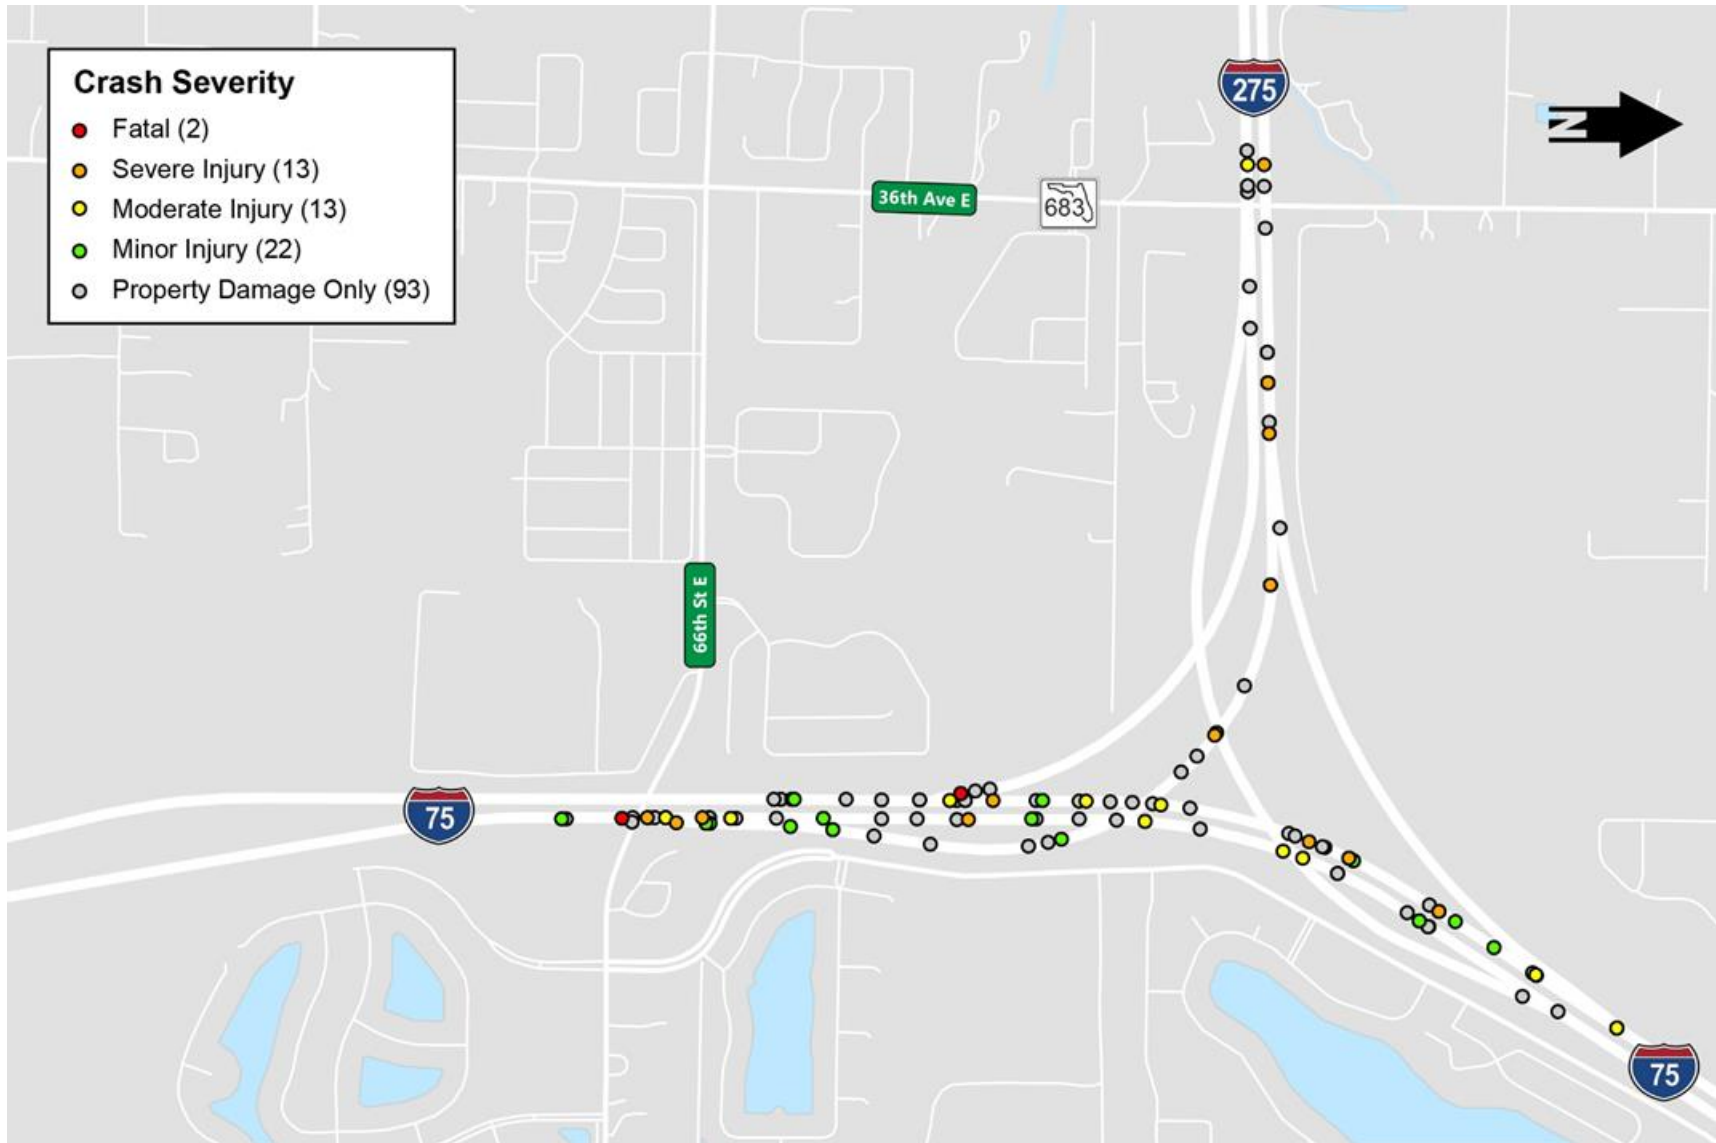

Table 12: Crash Severity – I-275 Segment Locations

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

US 41 at I-275

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes US 41 from 73rd Street East to 85th Street East and I-275 from west of US 41 to east of US 41 as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

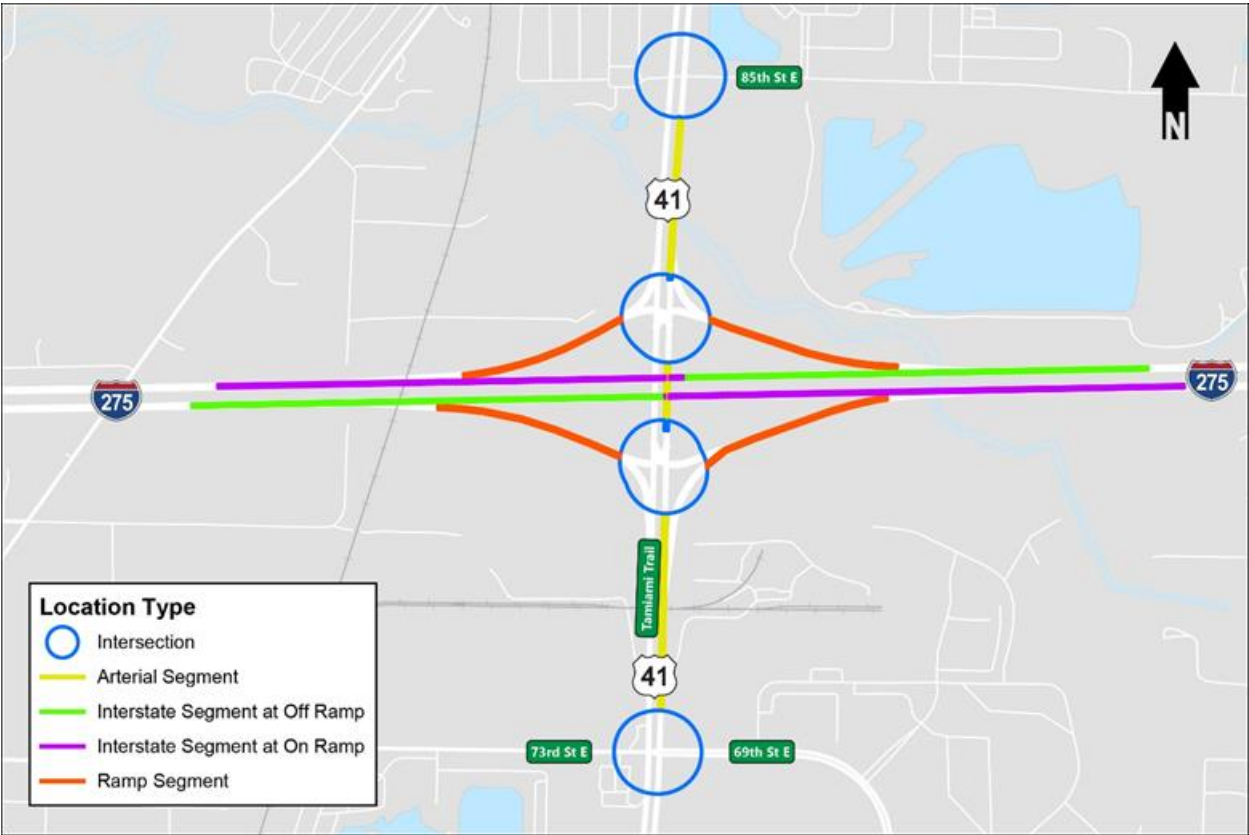

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 160 crashes involving 296 vehicles occurred during the analysis period resulting in two fatalities and 148 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred on US 41, accounting for 114 crashes, 223 vehicles, two fatalities, and 105 injuries. Along US 41, most of the crashes took place at intersections. In the three years from 2015 to 2017, crash frequency along US 41 was significantly higher than in 2013 and 2014. This occurred at both intersections and segments along US 41. It is also worth noting that crashes on northbound and southbound I-275 in 2015 were significantly higher than in the other years. Other locations show a low but constant crash frequency.

Table 1: Crash History by Roadway and Year

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. Only the US 41 at I-275 northbound ramp terminal intersection has a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. The areas of highest crash frequency are at US 41 intersections, including US 41 at 73rd Street East, US 41 at I-275 southbound ramp terminal, US 41 at I-275 northbound ramp terminal, and US 41 at 85th Street East.

The areas of high crash density are mainly the arterial intersections, including US 41 at 85th Street East, US 41 at I-275 northbound ramp terminal, US 41 at I-275 southbound ramp terminal, and US 41 at 73rd Street East. Additionally, the southbound I-275 at off-ramp segment shows crashes clustering at its intersection with US 41.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
73rd St E to I-275 SB Ramp Terminal	11	24,500	0.226	1.089	2.711	2.2	20.08%
I-275 SB to NB Ramp Terminals	4	18,100	0.078	1.552	2.711	0.8	14.31%
85th St E to I-275 NB Ramp Terminal	8	11,100	0.186	2.123	2.711	1.6	39.16%

* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
US 41 at 73rd St E	38	28,600	0.728	0.749	7.6	48.60%
US 41 at I-275 SB Ramp Terminal	21	31,500	0.365	0.343	4.2	50.00%
US 41 at I-275 NB Ramp Terminal	19	13,800	0.754	0.343	3.8	99.95%
US 41 at 85th St E	13	11,900	0.599	0.749	2.6	39.99%

* Intersections with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 4: Interstate Segment Crash Rates

Interstate Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
NB I-275 Mainline							
I-275 NB at Off-Ramp to US 41	7	22,800	0.532	0.316	0.976	1.4	14.16%

Unknown	0	0	0	0	0	0	0.0	0.0%
Total	19	15	59	34	33	160	32.0	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on arterial segments and interstate segments. At arterial intersections, left turn crashes were slightly more prevalent than rear end crashes.

The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance.

With regard to left turn crashes, the Highway Safety Manual (HSM) indicates that possible contributing factors include misjudging speed of on-coming traffic, pedestrian or bicycle conflicts, inadequate signal timing, and inadequate sight distance.

Figure 4 shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (80.6 percent) with clear or cloudy weather (90.6 percent) and dry roads (84.4 percent).

Table 11: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Only one location has at least 30 crashes. This location is US 41 at 73rd Street East, with a proportion of wet/slick/unpaved and standing water crashes at 21 percent and a proportion of crashes taking place in dark conditions with no lighting at 8 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %
US 41 Intersection						
US 41 at 73rd St E	38	8	0	21%	3	8%

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 160 total crashes, there were two fatal crashes, 84 crashes involving personal injury, and 74 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	1	1	2	0.4	1.3%
Severe Injury	1	4	6	9	4	24	4.8	15.0%
Moderate Injury	2	1	4	1	6	14	2.8	8.8%
Minor Injury	9	3	17	9	8	46	9.2	28.8%
Property Damage Only	7	7	32	14	14	74	14.8	46.3%
Total	19	15	59	34	33	160	32.0	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were two fatal crashes, 24 severe injury crashes, 14 moderate injury crashes, 46 minor injury crashes, and 74 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$50,174,630, which is an average of \$10,034,926 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, eight locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was US 41 Between 73rd Street East and I-275 southbound ramp terminal, with an estimated total five-year crash cost of \$22,834,590. The location with the highest average cost per crash was US 41 between 73rd Street East and I-275 southbound ramp terminal, with an average cost per crash of \$2,075,872.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
US 41 Between 73rd St E and I-275 SB Ramp Terminal	2	1	1	4	3	11	\$22,834,590	\$2,075,872	\$166,258
US 41 Between I-275 SB and NB Ramp Terminals	0	1	0	0	3	4	\$895,712	\$223,928	\$166,258

SAFETY MEMORANDUM

US 301 at I-75

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes US 301 from 51st Avenue East to B Street and I-75 from south of US 301 to north of US 301 as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into the following intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

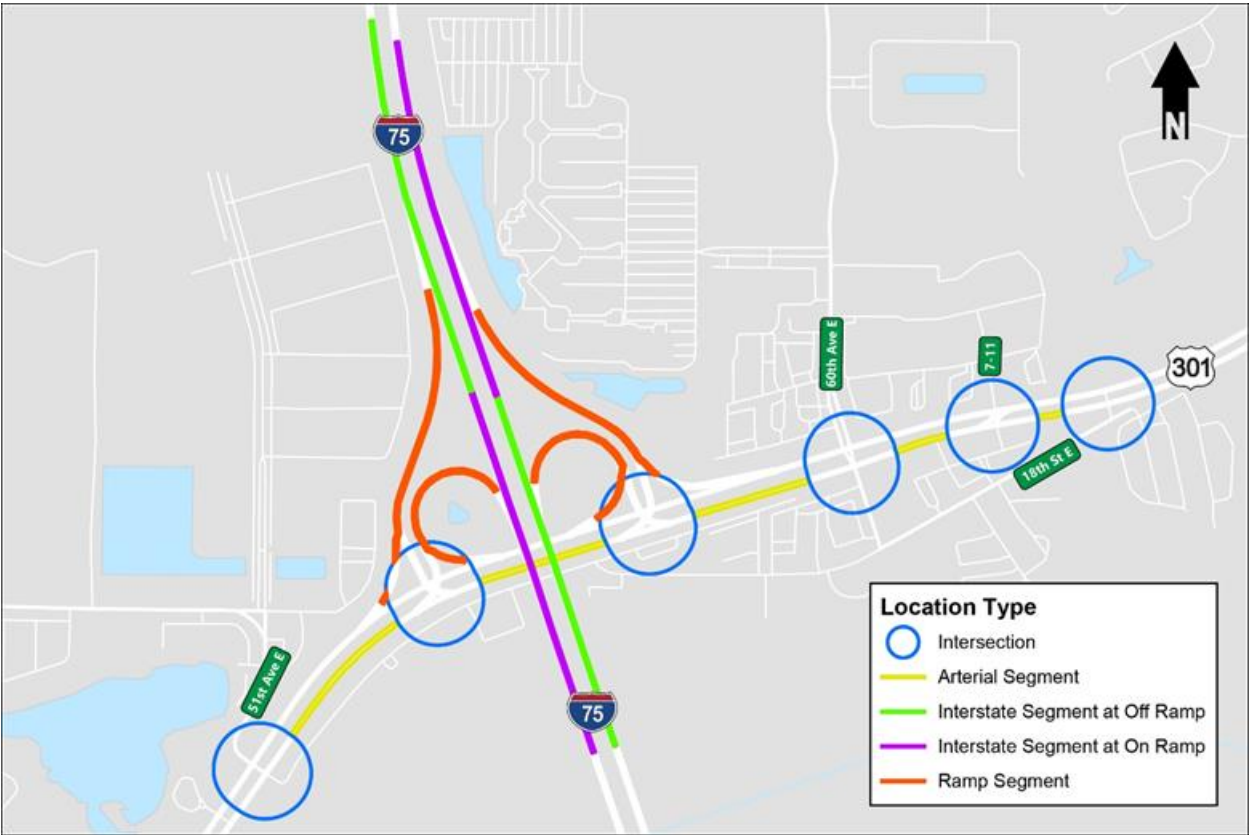

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 496 crashes involving 1,011 vehicles occurred during the analysis period resulting in one fatality and 349 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred on US 301, accounting for 343 crashes, 733 vehicles, one fatality, and 247 injuries. Generally, there were no long-term crash frequency trends throughout the study area. However, there were noticeable peaks in crash frequency on both northbound and southbound I-75 during 2014, and another spike in 2017 on southbound I-75. On ramps and off-ramps both experienced their highest yearly crash frequencies

in 2016. However, crash frequency on US 301 did not show any noticeable peaks or trends during the study period.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, Table 3, and Table 4 summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. Both the US 301 between I-75 southbound and northbound ramp terminal and the US 301 at 60th Ave E intersection have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting I-75 to the US 301 do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

There are three places in the study area where crashes tend to cluster, including US 301 at 51st Avenue East, US 301 at I-75 northbound ramp terminal and to the west of this intersection. Furthermore, moderate crash clustering is also present on US 301 at 60th Avenue East and on I-75 at both loop ramps.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
51st Ave E to I-75 SB Ramp Terminal	3	35,300	0.162	0.287	2.711	0.6	1.98%
I-75 SB to NB Ramp Terminal	93	35,300	0.137	10.537	2.711	18.6	99.99%
I-75 NB Ramp Terminal to 60th Ave E	20	38,100	0.125	2.301	2.711	4	42.44%
50th Ave E to North River Village Plaza	13	38,100	0.056	3.339	4.714	2.6	35.42%
North River Village Plaza to B St	4	38,100	0.027	2.131	3.634	0.8	14.66%

* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
US 301 at 51st Ave E	20	35,400	0.310	0.749	4	20.69%
US 301 at I-75 SB Ramp Terminal	19	40,900	0.255	0.343	3.8	37.17%
US 301 at I-75 NB Ramp Terminal	37	50,800	0.399	0.343	7.4	80.00%
US 301 at 60th Ave E	110	42,100	1.432	0.884	22	99.99%
US 301 at North River Village Plaza	17	39,200	0.238	0.884	3.4	13.46%
US 301 at B St	7	38,500	0.100	0.419	1.4	10.44%

* Intersections with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 4: Interstate Segment Crash Rates

Interstate Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
NB I-75 Mainline							
I-75 NB at Off-Ramp to US 301	18	49,600	0.383	0.519	0.976	3.6	26.59%
I-75 NB at On-Ramp from US 301	11	42,300	0.381	0.374	0.976	2.2	19.16%
SB I-75 Mainline

Total	83	100	112	89	112	496	99.2	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
51st Ave E to I-75 SB Ramp Terminal	Hit Fixed Object Rear End Sideswipe	1	33.3%
I-75 SB to NB Ramp Terminal	Rear End	75	80.6%

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (76.2 percent) with clear or cloudy weather (90.5 percent) and dry roads (83.9 percent).

Table 9: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at on-ramp from US 301 has the highest proportion of wet/slick/unpaved and standing water crashes at 33 percent, and US 301 at I-75 northbound ramp terminal has the highest proportion of crashes taking place in dark conditions with no lighting at 11 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %

I-75 SB to NB Ramp Terminal	93	11	0	12%	6	6%

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 496 total crashes, there were one fatal crash, 207 crashes involving personal injury, and 288 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	1	0	0	0	1	0.2	0.2%
Severe Injury	7	8	9	7	11	42	8.4	8.5%
Moderate Injury	8	5	10	6	8	37	7.4	7.5%
Minor Injury	20	27	21	24	36	128	25.6	25.8%
Property Damage Only	48	59	72	52	57	288	57.6	58.1%
Total	83	100	112	89	112	496	99.2	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were 42 severe injury crashes, one fatal crash, 37 moderate injury crashes, 128 minor injury crashes, and 288 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$69,571,490, which is an average of \$13,914,298. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, six locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red. The location with the highest comprehensive crash cost was US 301 at 60th Avenue East, with an estimated total 5-year crash cost of \$12,523,142. The location with the highest average cost per crash was US 301 at 51st Avenue East, with an average cost per crash of \$595,317.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

SR 64 at I-75

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes SR 64 from Kay Road to Grand Harbour Parkway and I-75 from south of SR 64 to north of SR 64 as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

It is worth noting that this interchange was reconstructed in late 2017 into a traditional diamond interchange and to provide for a ten-lane roadway along I-75 and to widen SR 64 from segment west of I-75 southbound ramp terminal and segment east of I-75 northbound ramp terminal. The safety analysis in this report is based on the historical crash data from 2013 through 2017, prior to this reconstruction. However, any changes in safety performance due to this construction cannot be analyzed until sufficient historical data is available. Safety issues on which the reconstruction may impact will be discussed in the following sections.

Figure 1: Study Area Locations

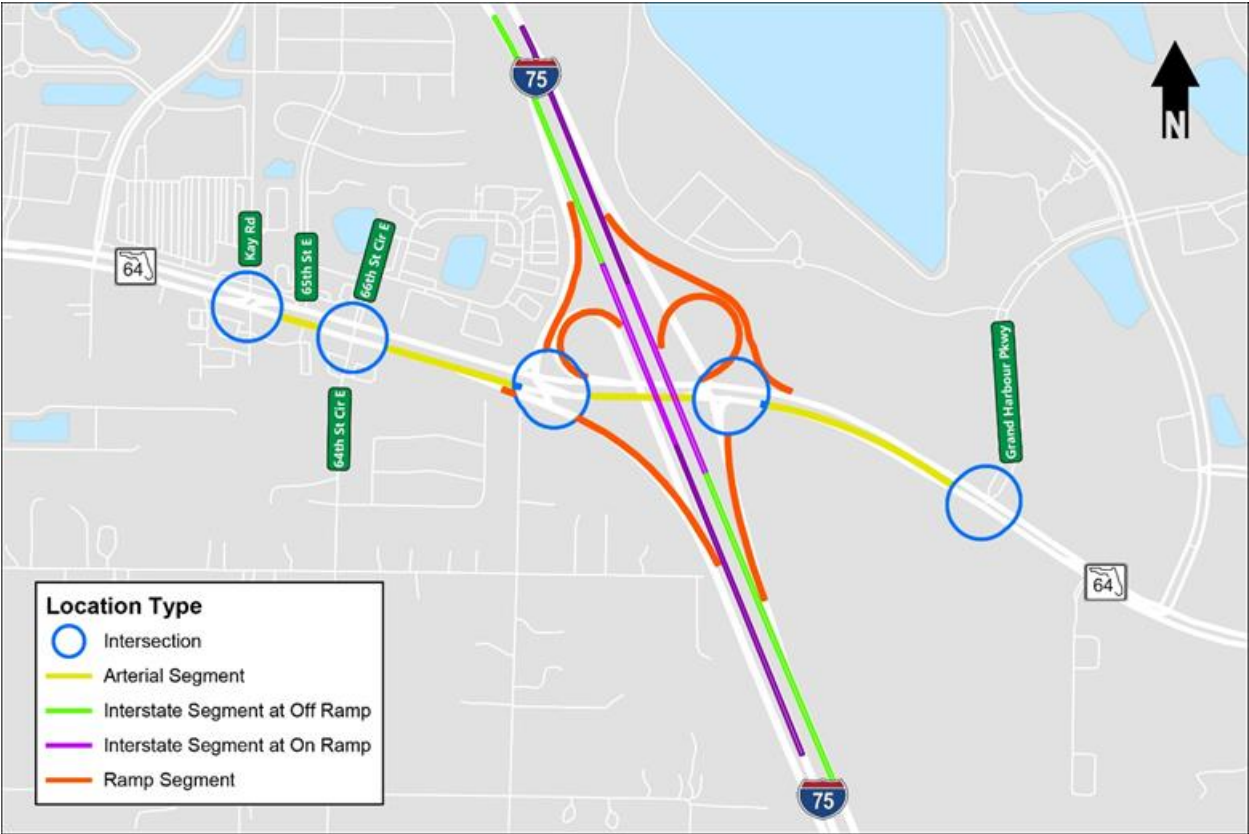

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 479 crashes involving 951 vehicles occurred during the analysis period resulting in three fatalities and 320 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at intersections on SR 64, accounting for 200 crashes, 418 vehicles, two fatalities, and 118 injuries.

Crash frequency on I-75 northbound and southbound segments has generally increased from 2013 through 2017. Intersections on SR 64 experienced a high crash frequency in 2014 and 2015 of 42 and 55 per year respectively, while in the other three years it averaged closer to 34 crashes per year. Crash frequency on SR 64 segments fluctuated widely. Crash frequency in 2013, 2015 and 2017 was much higher than in 2014 and 2016.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. Three locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. They are SR 64 at 64th Street Court East / 66th Street Court East, northbound I-75 NB at off-ramp to westbound SR 64, and southbound I-75 at on-ramp from westbound SR 64. Additionally, the seven ramp segments connecting I-75 to SR 64 do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

The area where crashes clustered is the west leg of SR 64 at 64th Street Court East/ 66th Street Court East intersection. The west leg of SR 64 at Grand Harbour Parkway intersection and the west leg of SR 64 at Kay Road intersection also have clusters of crashes. The reconstruction of the interchange is unlikely to affect the crash frequency at these hot spots because these locations are out of the reconstruction area.

However, the reconstruction might impact the other two locations with crash clusters. These include the northbound I-75 segment just south of the off-ramp to westbound SR 64 and the SR 64 at I-75 northbound ramp terminal intersection.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Kay Rd to 64th St Ct E	15	45,400	0.057	3.176	2.711	3	75.00%
64th St Ct E to I-75 SB Ramp Terminal	8	45,400	0.191	0.506	2.711	1.6	9.33%

Total	69	82	112	96	120	479	95.8	100.0%

Table 7, Table 8, and Table 9 summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

The frequency of rear end crashes may decrease due to the interchange reconstruction. The widening of the roadways may increase capacity and mitigate traffic congestion often associated with rear end crashes.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (81.4 percent) with clear or cloudy weather (87.9 percent) and dry roads (80.0 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Surface Condition								
Dry	58	69	85	74	97	383	76.6	80.0%

Total	69	82	112	96	120	479	95.8	100.0%

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at on-ramp from eastbound SR 64 has the highest proportion of wet/slick/unpaved and standing water crashes at 30 percent, and northbound I-75 at off-ramp to eastbound SR 64 has the highest proportion of crashes taking place in dark conditions with no lighting at 19 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 479 total crashes, there were three fatal crashes, 182 crashes involving personal injury, and 294 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	2	1	3	0.6	0.6%
Severe Injury	7	5	9	10	12	43	8.6	9.0%
Moderate Injury	8	7	1	8	13	37	7.4	7.7%
Minor Injury	18	19	14	24	27	102	20.4	21.3%
Property Damage Only	36	51	88	52	67	294	58.8	61.4%
Total	69	82	112	96	120	479	95.8	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 43 severe injury crashes, 37 moderate injury crashes, 102 minor injury crashes, and 294 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$89,068,712, which is an average of \$17,813,742 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in Appendix F. Overall, eight locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red. The location with the highest comprehensive crash cost was SR 64 at 64th Street Court East / 66th Street Court East, with an estimated total five-year crash cost of \$20,713,314. The location with the highest average cost per crash was SR 64 at Kay Road, with a five-year average cost per crash of \$474,678. This location also has low confidence of having a crash rate more than the statewide average, 24%.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

2.5 Contributing Causes

A summary of crashes by driver contributing cause for is shown in **Table 17**. Among the contributing causes documented in the crash data, careless/negligent driving (291 crashes, 60.8 percent) was the highest.

Table 17: Contributing Causes Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

SAFETY MEMORANDUM

SR 70 at I-75

WPI Segment No.: 442518-3

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes SR 70 from Creekwood Boulevard / Tora Boulevard to 87th Street East, Creekwood Boulevard from 55th Avenue East to 52nd Place East, and I-75 from south of SR 70 to north of SR 70 as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

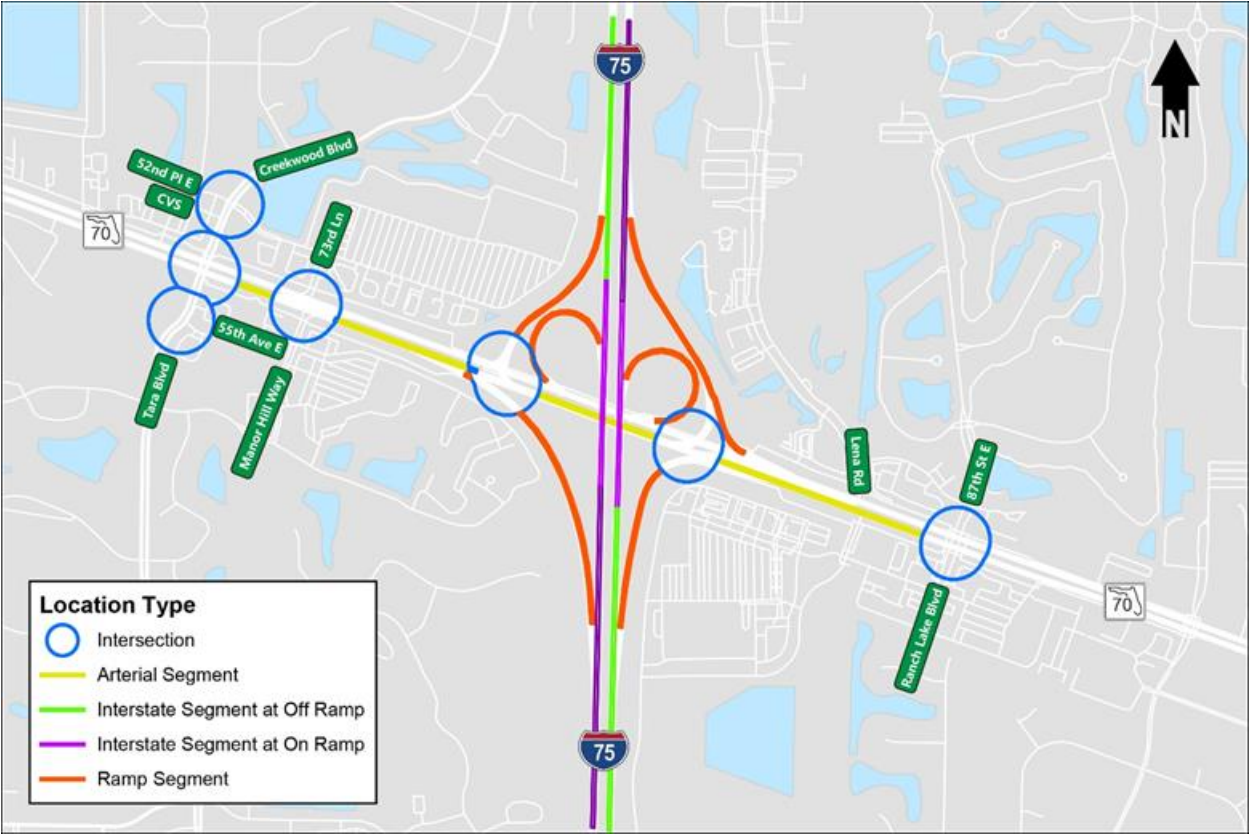

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 869 crashes involving 1,775 vehicles occurred during the analysis period resulting in six fatalities and 455 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at intersections on SR 70, accounting for 362 crashes, 746 vehicles, two fatalities and 192 injuries. Crash frequency on northbound and southbound I-75 segments generally increased from 2013 to 2017. During that period, total crashes on SR 70 was the highest in 2015, accounting for 84 crashes on segments and 52 at intersections. Other locations had low crash frequency and no remarkable trends.

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. The following five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher:

- SR 70 East of I-75 Northbound Ramp Terminal
- SR 70 at I-75 Southbound Ramp Terminal
- Creekwood Boulevard at 52nd Place East
- I-75 Northbound at Off-Ramp to Westbound SR 70
- I-75 Northbound at On-Ramp from Westbound SR 70

Additionally, the six ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

The areas of high crash density are mainly the arterial intersections, including SR 70 at Creekwood Boulevard / Tora Boulevard, SR 70 at 73rd Lane East / Manor Hill Lane East, SR 70 at 87th Street East, and SR 70 at I-75 southbound ramp terminal and northbound ramp terminal. Another location

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

of high crash density is found on southbound I-75 segments between on-ramp from westbound SR 70 and on-ramp from eastbound SR 70.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Creekwood Blvd to 73rd Ln E	5	64,000	0.055	0.778	4.714	1	5.16%

Total	129	139	212	191	198	869	173.8	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (83.2 percent) with clear or cloudy weather (88.4 percent) and dry roads (80.1 percent).

Table 10: Crash Conditions Summary

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, SR 70 at Creekwood Boulevard / Tara Boulevard has the highest proportion of wet/slick/unpaved and standing water crashes at 29 percent, and northbound I-75 at the off-ramp to eastbound SR 70 has the highest proportion of crashes taking place in dark conditions with no lighting at 26 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 869 total crashes, there were six fatal crashes, 295 crashes involving personal injury, and 568 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	1	3	1	1	6	1.2	0.7%
Severe Injury	2	7	20	13	17	59	11.8	6.8%
Moderate Injury	10	12	8	13	11	54	10.8	6.2%
Minor Injury	32	28	34	45	43	182	36.4	20.9%
Property Damage Only	85	91	147	119	126	568	113.6	65.4%
Total	129	139	212	191	198	869	173.8	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were six fatal crashes, 59 severe injury crashes, 54 moderate injury crashes, 182 minor injury crashes, and 568 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$148,605,810, which is an average of \$29,721,162 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, 10 locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was SR 70 between I-75 southbound and northbound ramp terminals, with an estimated total five-year crash cost of \$24,096,732. The same location also had the highest average cost per crash of \$651,263.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

University Parkway at I-75

WPI Segment No.: 442518-3

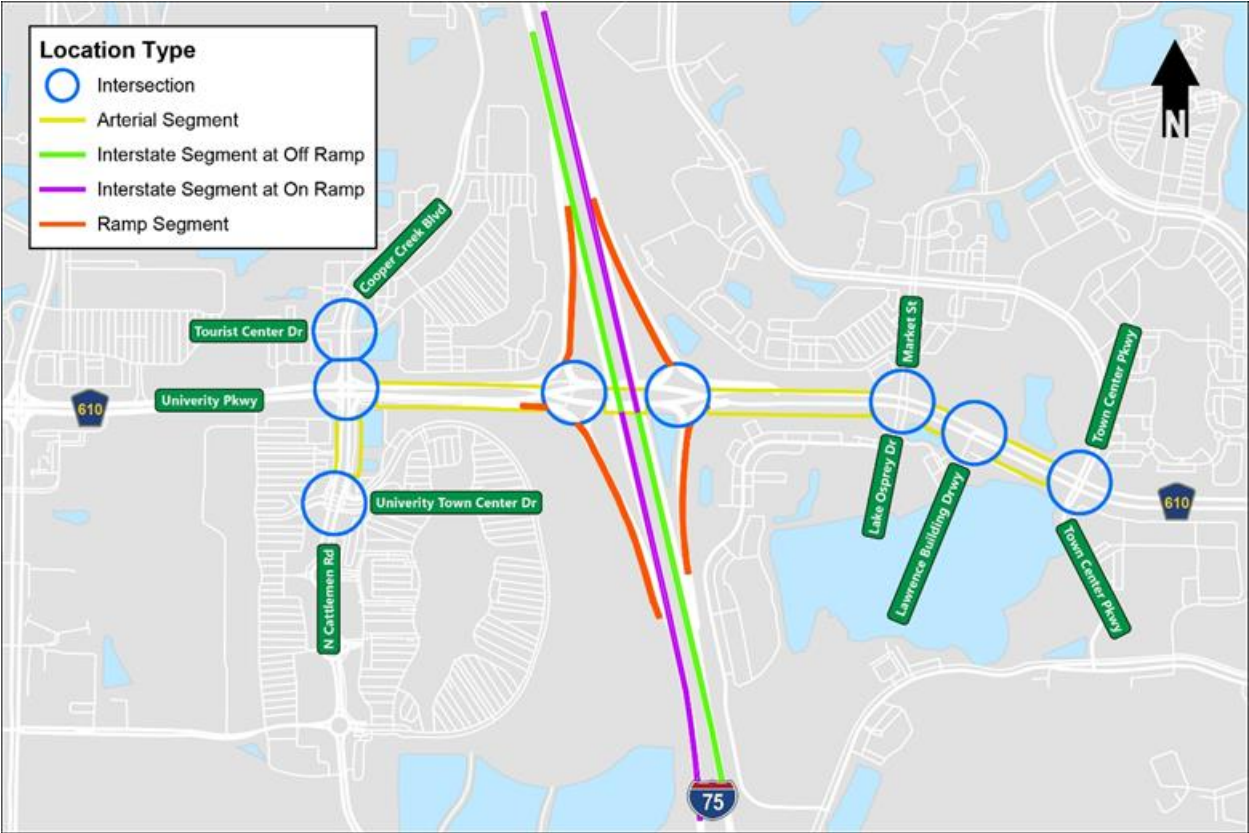

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes University Parkway from North Cattlemen Road / Cooper Creek Boulevard to Town Center Parkway, North Cattlemen Road / Cooper Creek Boulevard from the Mall at University Town Center to Tourist Center Drive, and I-75 from south of University Parkway to north of University Parkway as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the Manatee-Sarasota county line between the off-ramp and on-ramp gore points. The on-ramp segments extend from the county line to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

This interchange was under construction starting in 2015 and was converted to a diverging diamond interchange (DDI) during late 2017. Therefore, the data used in this report contains the crash records during the construction period. Although the safety analysis of this report is able to show the historical safety conditions from 2013 to 2017, the conversion of the interchange from a traditional diamond interchange to a DDI will likely impact safety performance. Further analysis of this location should be performed once data through 2022 is available to reassess safety performance at this interchange. This analysis will discuss ways in which the construction may impact historical safety issues.

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 844 crashes involving 1,810 vehicles occurred during the analysis period resulting in zero fatalities and 556 injuries. This crash data is included in **Appendix F**. Crashes were closely split among northbound I-75 segments, southbound I-75 segments, and intersections on University Parkway. The northbound I-75 segments accounted for 230 crashes, 470 vehicles, no fatalities, and 166 injuries. The southbound I-75 segments accounted for 261 crashes, 587 vehicles, no fatalities, and 167 injuries. The intersections on University Parkway accounted for 235 crashes, 500 vehicles, no fatalities, and 203 injuries.

Crash frequency on northbound I-75 segments witnessed a significant increase from 2013 to 2016, and then a slight decrease in 2017. The southbound I-75 segments had remarkably high crash frequency in 2015 and 2016. The number of crashes, on these segments, in 2016 was almost as four times as in 2013, 2014, or 2017. These trends may be related to the interchange construction from 2015 through the end of 2017. The University Parkway show a basically constant crash frequency from 2013 through 2017.

Table 1: Crash History by Roadway and Year

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. The following five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher:

- University Parkway at North Cattlemen Road / Cooper Creek Boulevard
- Northbound I-75 at Off-Ramp to University Parkway
- Northbound I-75 at On-Ramp from University Parkway
- Southbound I-75 at from University Parkway
- Southbound I-75 at Off-Ramp to University Parkway

Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

The area with highest crash density is University Parkway at North Cattlemen Road / Cooper Creek Boulevard, especially the west leg. Other locations with high crash density are I-75 segments between the off-ramp and on-ramp to University Parkway (both the northbound segments and southbound

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

segments). The DDI construction project described in Section 1.0 included the addition of an auxiliary lane in both directions on the interstate, which may affect crash frequency on these segments.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Cattlemen Rd Segment

Total	102	131	191	259	161	844	168.8	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

According to *FHWA Diverging Diamond Interchange Informational Guide*, diverging diamond interchanges have less conflict points than conventional diamond interchanges. The reduction in conflict points is related to the unique crossover movements. The crossovers remove all exit ramp to entrance ramp through movements and eliminate several left-turning conflicts between the ramp and cross street. Theoretically speaking, the DDI offers a safety benefit due to reduced conflicts—especially crossing conflicts—and speed-controlling curvature of the crossover movements.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (82.0 percent) with clear or cloudy weather (89.1 percent) and dry roads (85.2 percent).

Table 10: Crash Conditions Summary

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at off-ramp to University Parkway has both the highest proportion of wet/slick/unpaved and standing water crashes (29 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (11 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 844 total crashes, there were no fatal crashes, 307 crashes involving personal injury, and 537 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	0	0	0.0	0.0%
Severe Injury	4	5	23	31	13	76	15.2	9.0%
Moderate Injury	9	15	8	14	10	56	11.2	6.6%
Minor Injury	20	31	29	55	40	175	35.0	20.7%
Property Damage Only	69	80	131	159	98	537	107.4	63.6%
Total	102	131	191	259	161	844	168.8	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were no fatal crashes, 76 severe injury crashes, 56 moderate injury crashes, 175 minor injury crashes, and 537 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$98,786,045, which is an average of \$19,757,209 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, two locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was southbound I-75 at off-ramp to University Parkway, with an estimated total five-year crash cost of \$22,272,489. The location with the highest average cost per crash was University Parkway at Town Center Parkway, with an average cost per crash of \$211,955.

SAFETY MEMORANDUM

Fruitville Road at I-75

WPI Segment No.: 442518-1

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes Fruitville Road from Cattlemen Road to Coburn Road and I-75 from south of Fruitville Road to north of Fruitville Road as well as the on- and off- ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

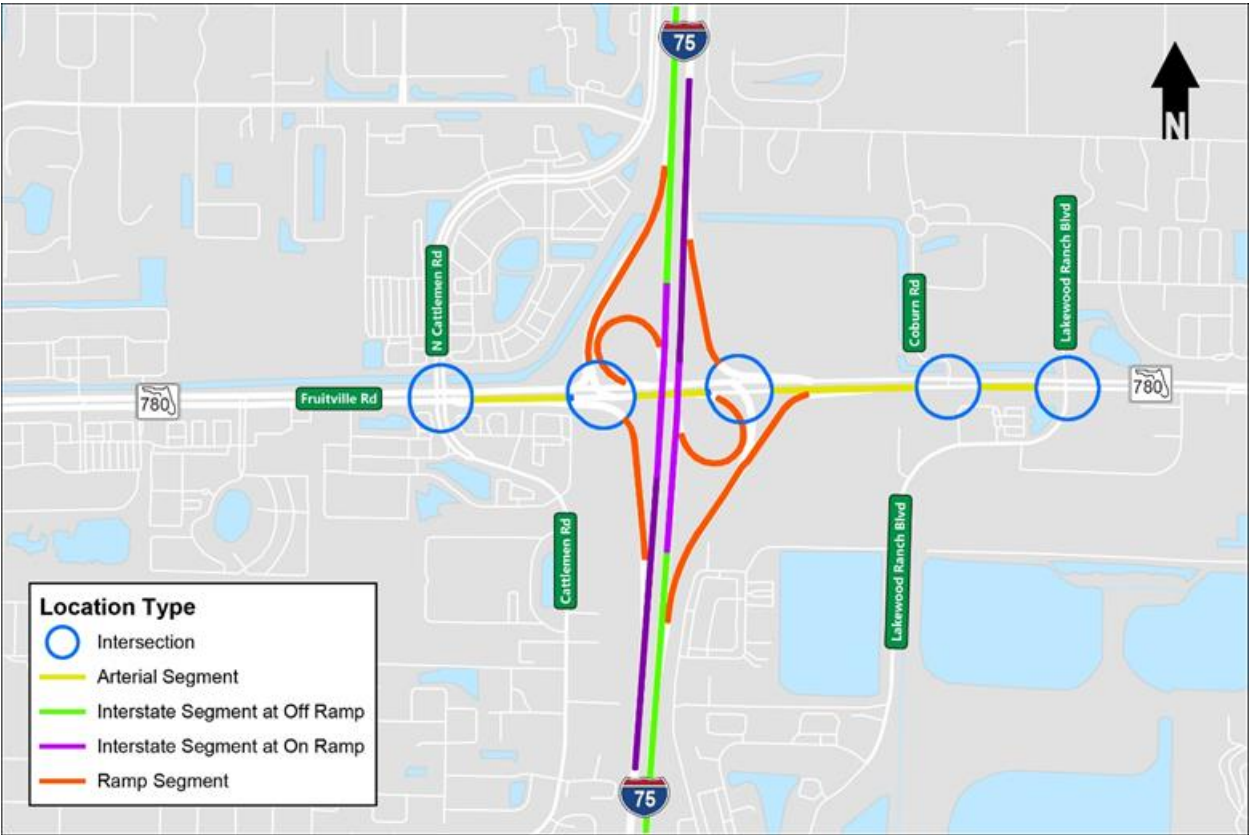

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 673 crashes involving 1,345 vehicles occurred during the analysis period resulting in six fatalities and 353 injuries. This crash data is included in **Appendix F**. The majority of crashes occurred on northbound I-75 segments and intersections on Fruitville Road. The northbound I-75 segments accounted for 192 crashes, 355 vehicles, zero fatalities, and 106 injuries. Intersections on Fruitville Rd accounted for 266 crashes, 577 vehicles, zero fatalities, and 135 injuries.

Crash frequency on all roadways was generally constant with only small fluctuations. It is worth noting that a small number of crashes was witnessed on northbound I-75 segments in 2014, on southbound I-75 segments in 2013, and at Fruitville Road intersections in 2017.

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. The following five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher:

- Fruitville Road at Cattlemen Road
- Fruitville Road at I-75 Southbound Ramp Terminal
- Northbound I-75 at Off-Ramp to Fruitville Road
- Northbound I-75 at On-Ramp from Eastbound Fruitville Road
- Southbound I-75 at On-Ramp from Westbound Fruitville Road

Additionally, the six ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. The areas of high crash density are northbound I-75 at on-ramp from eastbound Fruitville Road, the north leg of the I-75 southbound ramp terminal intersection, and Fruitville Road at Cattlemen Road, especially the west leg.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Coburn Rd (North) to Coburn Rd (South)	0	4,800	0.086	0.000	1.730	0	0.00%

Total	120	124	147	152	130	673	134.6	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (80.7 percent) with clear or cloudy weather (82.3 percent) and dry roads (72.5 percent).

Table 10: Crash Conditions Summary

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at on-ramp from eastbound Fruitville Road has the highest proportion of wet/slick/unpaved and standing water crashes at 63 percent, and southbound I-75 at off-ramp to Fruitville Road has the highest proportion of crashes taking place in dark conditions with no lighting at 19 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 673 total crashes, there were six fatal crashes, 238 crashes involving personal injury, and 429 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	0	1	2	2	6	1.2	0.9%
Severe Injury	3	2	6	14	8	33	6.6	4.9%
Moderate Injury	18	15	13	20	9	75	15.0	11.1%
Minor Injury	26	34	23	30	17	130	26.0	19.3%
Property Damage Only	72	73	104	86	94	429	85.8	63.7%
Total	120	124	147	152	130	673	134.6	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were six fatal crashes, 33 severe injury crashes, 75 moderate injury crashes, 130 minor injury crashes, and 429 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$122,978,796, which is an average of \$24,595,759 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, five locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was southbound I-75 at off-ramp to Fruitville Road, with an estimated total five-year crash cost of \$36,818,882. The location with the highest average cost per crash was Fruitville Road between I-75 northbound ramp terminal and Coburn Road (North), with an average cost per crash of \$1,232,772.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

Bee Ridge Road at I-75

WPI Segment No.: 442518-1

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes Bee Ridge Road from Maxfield Drive to Mauna Loa Boulevard, Cattlemen Road from Bee Ridge Road to Maxfield Drive / Cattleridge Boulevard and I-75 from south of Bee Ridge Road to north of Bee Ridge Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

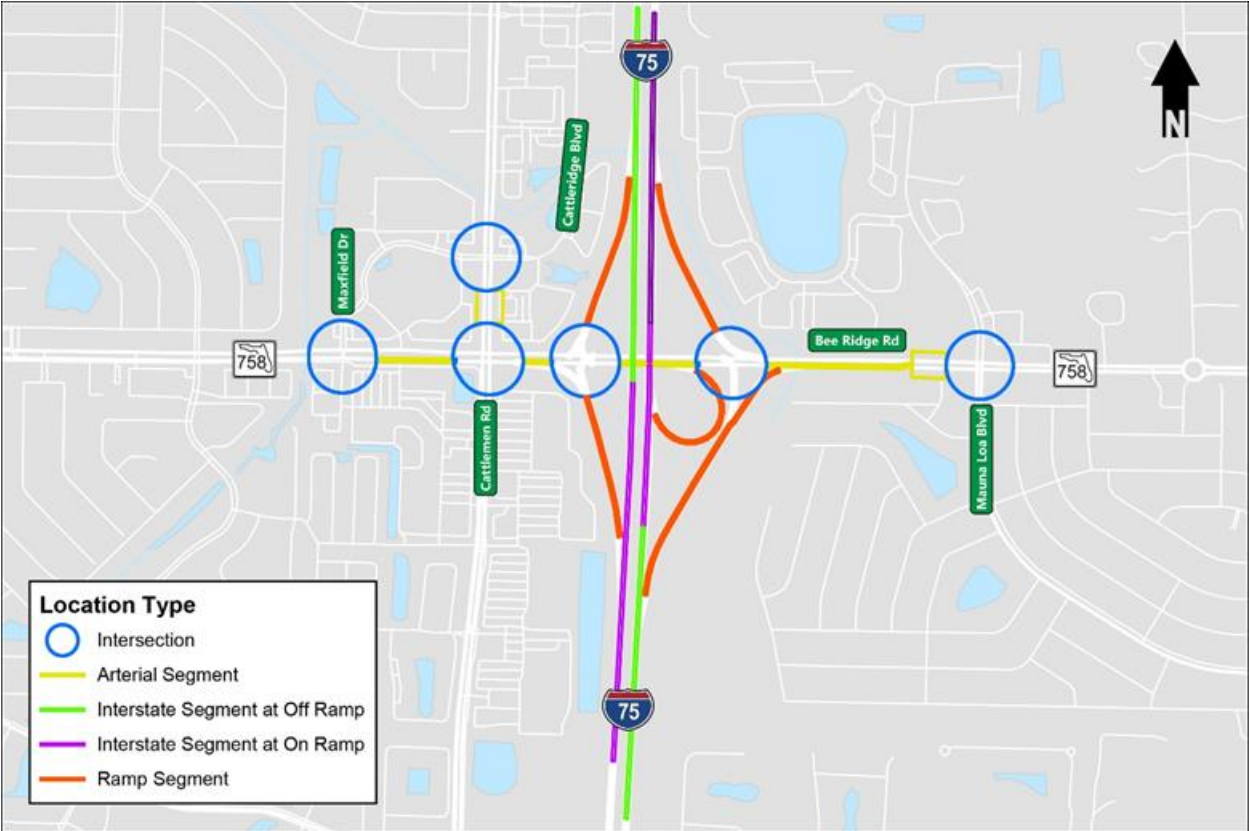

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 487 crashes involving 998 vehicles occurred during the analysis period resulting in one fatality and 243 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at intersections on Bee Ridge Road, accounting for 262 crashes, 545 vehicles, one fatality, and 121 injuries.

For intersections on Bee Ridge Road, the number of crashes peaked in 2015 (67 crashes), which is significantly more than in other years (about 49 crashes per year). It is also worth noting that the number of crashes on northbound I-75 segments and Bee Ridge Road segments in 2013 and 2014 was less than in the three years from 2015 to 2017. The crash frequency of the other roadways is basically low, and there is no obvious trend.

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. Both Bee Ridge Road at I-75 southbound ramp terminal and northbound I-75 at the on-ramp from eastbound Bee Ridge Road have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

The areas of high crash density are mainly the arterial intersections, including Bee Ridge Road at Maxfield Drive, Bee Ridge Road at Cattlemen Road (especially the east leg), Bee Ridge Road at I-75 southbound ramp terminal (with noticeable clusters along each leg), Bee Ridge Road at I-75 northbound ramp terminal, Bee Ridge Road at Mauna Loa Boulevard, and Cattlemen Road at Maxfield Drive / Cattleridge Boulevard.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Cattlemen Rd Segment							
Bee Ridge Rd to Maxfield Dr	1	25,500	0.046	0.467	3.634	0.2	0.80%
Bee Ridge Rd Segments							
Cattlemen Rd to I-75 SB Ramp Terminal	4	37,200	0.041	1.437	4.714	0.8	7.62%
Bee Ridge Rd East of Maxfield Dr	3	37,200	0.056	0.789	3.634	0.6	4.07%
Maxfield Dr to Cattlemen Rd	5	37,200	0.056	1.315	4.714	1	8.72%
I-75 SB to NB Ramp Terminals	34	31,800	0.112	5.231	4.714	6.8	75.00%
I-75 NB Ramp Terminal to Mauna Loa Blvd	15	26,900	0.205	1.490	1.730	3	43.06%

* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Bee Ridge Rd at Maxfield Dr	43	40,800	0.577	0.623	8.6	46.31%
Bee Ridge Rd at Cattlemen Rd	95	58,700	0.887	0.884	19	50.00%
Bee Ridge Rd at I-75 SB Ramp Terminal	84	51,500	0.894	0.479	16.8	99.99%
Bee Ridge Rd at I-75 NB Ramp Terminal	19	35,600	0.292	0.479	3.8	30.48%
Bee Ridge Rd at Mauna Loa Blvd	21	20,500	0.561	0.517	4.2	50.00%
Cattlemen Rd at Maxfield Dr / Cattleridge Blvd	24	28,700	0.458	0.623	4.8	36.76%

* Intersections with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 4: Interstate Segment Crash Rates

Total	74	85	118	95	115	487	97.4	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (79.7 percent) with clear or cloudy weather (91.4 percent) and dry roads (85.0 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at on-ramp from westbound Bee Ridge Road has both the highest proportion of wet/slick/unpaved and standing water crashes (38 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (13 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 487 total crashes, there were 168 crashes involving personal injury, one fatal crash, and 318 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	1	0	1	0.2	0.2%
Severe Injury	5	4	2	7	11	29	5.8	6.0%
Moderate Injury	9	12	6	11	5	43	8.6	8.8%
Minor Injury	18	13	26	20	19	96	19.2	19.7%
Property Damage Only	42	56	84	56	80	318	63.6	65.3%
Total	74	85	118	95	115	487	97.4	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were 29 severe injury crashes, one fatal crash, 43 moderate injury crashes, 96 minor injury crashes, and 318 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$56,103,762, which is an average of \$11,220,752 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, five locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was Bee Ridge Road at I-75 southbound ramp terminal, with an estimated total five-year crash cost of \$16,046,833. The location with the highest average cost per crash was off-ramp from southbound I-75 to Bee Ridge Road, with an average cost per crash of \$384,282.

Table 13: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

Clark Road at I-75

WPI Segment No.: 442518-1

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes SR 72 Clark Road from Gantt Road / Approach Road to Hummingbird Avenue and I-75 from south of SR 72 Clark Road to north of SR 72 Clark Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

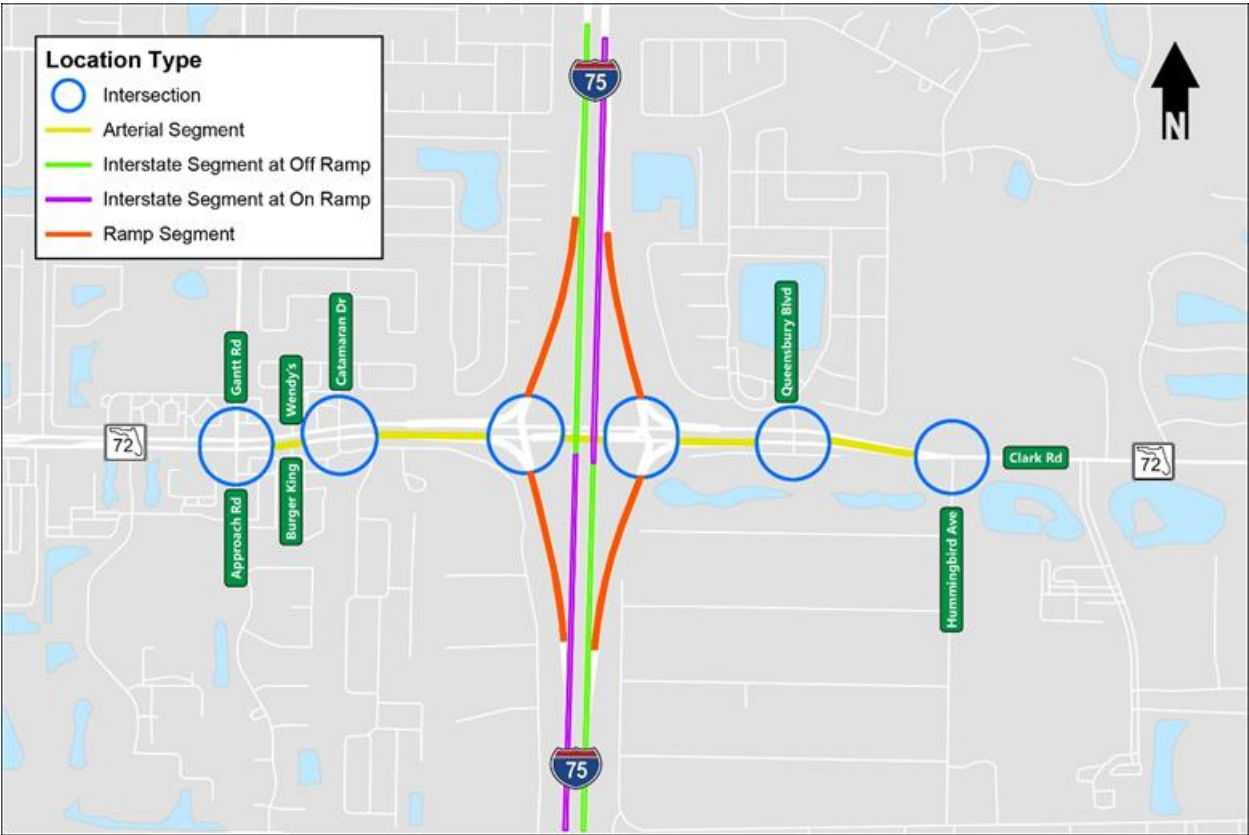

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 494 crashes involving 991 vehicles occurred during the analysis period resulting in three fatalities and 239 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at intersections on SR 72 Clark Road, accounting for 266 crashes, 549 vehicles, one fatality, and 129 injuries.

For the intersections on SR 72 Clark Road, the number of crashes was relatively constant from 2014 through 2016, while the number was slightly smaller in 2013 and larger in 2017. On northbound I-75 segments, crash frequency was significantly less in 2013 and 2014 than in the three years from 2015

to 2017. The other locations only accounted for a small portion of total crashes, and there is no remarkable trend.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries
NB I-75 Mainline Segments				
2013	13	24	0	6
2014	9	15	0	8

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. The following four locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher:

- Clark Road at I-75 Southbound Ramp Terminal
- Clark Road at I-75 Northbound Ramp Terminal
- Northbound I-75 at On-Ramp from Clark Road
- Southbound I-75 at On-Ramp from Clark Road

Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

The areas of high crash density are mainly the arterial intersections, including Clark Road at Gantt Road / Approach Road (especially the west leg), Clark Road at Catamaran Drive (especially the west leg), Clark Road at I-75 southbound ramp terminal, and both ramp terminals. Crash clustering is

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

particularly pronounced at the ends of both ramp segments connecting to the arterial, as well as along Clark Road on both the east and west legs of the ramp terminal.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Gantt Rd to Catamaran Dr	6	43,600	0.042	1.795	4.714	1.2	14.28%
Catamaran Dr to I-75 SB Ramp Terminal	29	43,600	0.145	2.514	2.711	5.8	46.37%

Total	74	105	103	103	109	494	98.8	100.0%

Table 6, **Table 7**, and **Table 8** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (83.6 percent) with clear or cloudy weather (87.7 percent) and dry roads (82.4 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Clark Road at I-75 northbound ramp terminal has the highest proportion of wet/slick/unpaved and standing water crashes at 31 percent, and southbound I-75 at off-ramp to Clark Road has the highest proportion of crashes taking place in dark conditions with no lighting at 19 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 494 total crashes, there were three fatal crashes, 164 crashes involving personal injury, and 327 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	1	1	1	0	3	0.6	0.6%
Severe Injury	0	1	6	6	8	21	4.2	4.3%
Moderate Injury	12	14	9	3	9	47	9.4	9.5%
Minor Injury	18	26	14	22	16	96	19.2	19.4%
Property Damage Only	44	63	73	71	76	327	65.4	66.2%
Total	74	105	103	103	109	494	98.8	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 12, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 21 severe injury crashes, 47 moderate injury crashes, 96 minor injury crashes, and 327 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$71,228,238, which is an average of \$14,245,648 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, four locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was Clark Road at I-75 southbound ramp terminal, with an estimated total five-year crash cost of \$20,072,213. The location with the highest average cost per crash was northbound I-75 at off-ramp to Clark Road, with an average cost per crash of \$323,498.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Gantt Rd to Catamaran Dr	0	0	0	1	5	6	\$144,715	\$24,119	\$123,598
Catamaran Dr to I-75 SB Ramp Terminal	0	0	1	9	19	29	\$1,276,253	\$44,009	\$166,258

SAFETY MEMORANDUM

SR 681 at I-75

WPI Segment No.: 442518-2

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes the west portion of SR 681 in the vicinity of its connection to I-75 and I-75 in the vicinity of its connection to SR 681. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The segments on the arterial include the roadway to the east of the Honore Avenue and SR 681 intersection. Due to the Honore Avenue extension project changing the configuration of this intersection in 2016, historical crash analysis was not conducted at this intersection. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 37 crashes involving 50 vehicles occurred during the analysis period resulting in zero fatalities and 15 injuries. This crash data is included in **Appendix F**. Crashes were closely split among northbound I-75 segments, southbound I-75 segments, and SR 681 segments. The northbound I-75 segments accounted for 10 crashes, 14 vehicles, zero fatalities, and one injury. The southbound I-75 segments accounted for 12 crashes, 16 vehicles, zero fatalities, and seven injuries. The SR 681 segments accounted for 14 crashes, 19 vehicles, no fatalities, and 7 injuries. Crash frequency on SR 681 segments shows a decreasing trend. However, all the locations had low crash frequency from 2013 through 2017.

Table 1: Crash History by Roadway and Year

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2 and **Table 3** summarize the crash rates for the arterial segments and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the off-ramp from southbound I-75 to southbound SR 681 does not have a statewide average crash rate associated with its facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

There are clusters of crashes on northbound I-75 both to the south and north of the ramp gore of the on-ramp from SR 681. A third cluster is present on SR 681 segment just west of I-75. However, it should be emphasized that the overall crash frequency in the study area is low and that the clusters of crashes shown still represent only a small number of actual crashes.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
North of Honore Ave	4	14,400	0.402	0.379	1.730	0.8	5.48%
South of I-75	10	14,400	0.947	0.402	2.238	2	8.98%

* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Interstate Segment Crash Rates

Total	9	8	7	7	6	37	7.4	100.0%

Table 6 and **Table 7** summarize the most frequent crash type for arterial segments and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Hit-fixed-object crashes were the most common at both location types. The Highway Safety Manual (HSM) indicates that possible contributing factors for hit-fixed-object crashes include

- Obstruction in or near roadway
- Inadequate lighting
- Inadequate pavement markings
- Inadequate signs, delineators, or guardrail
- Slippery pavement
- Roadside Design
- Inadequate roadway geometry
- Excessive speed

Figure 4 shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

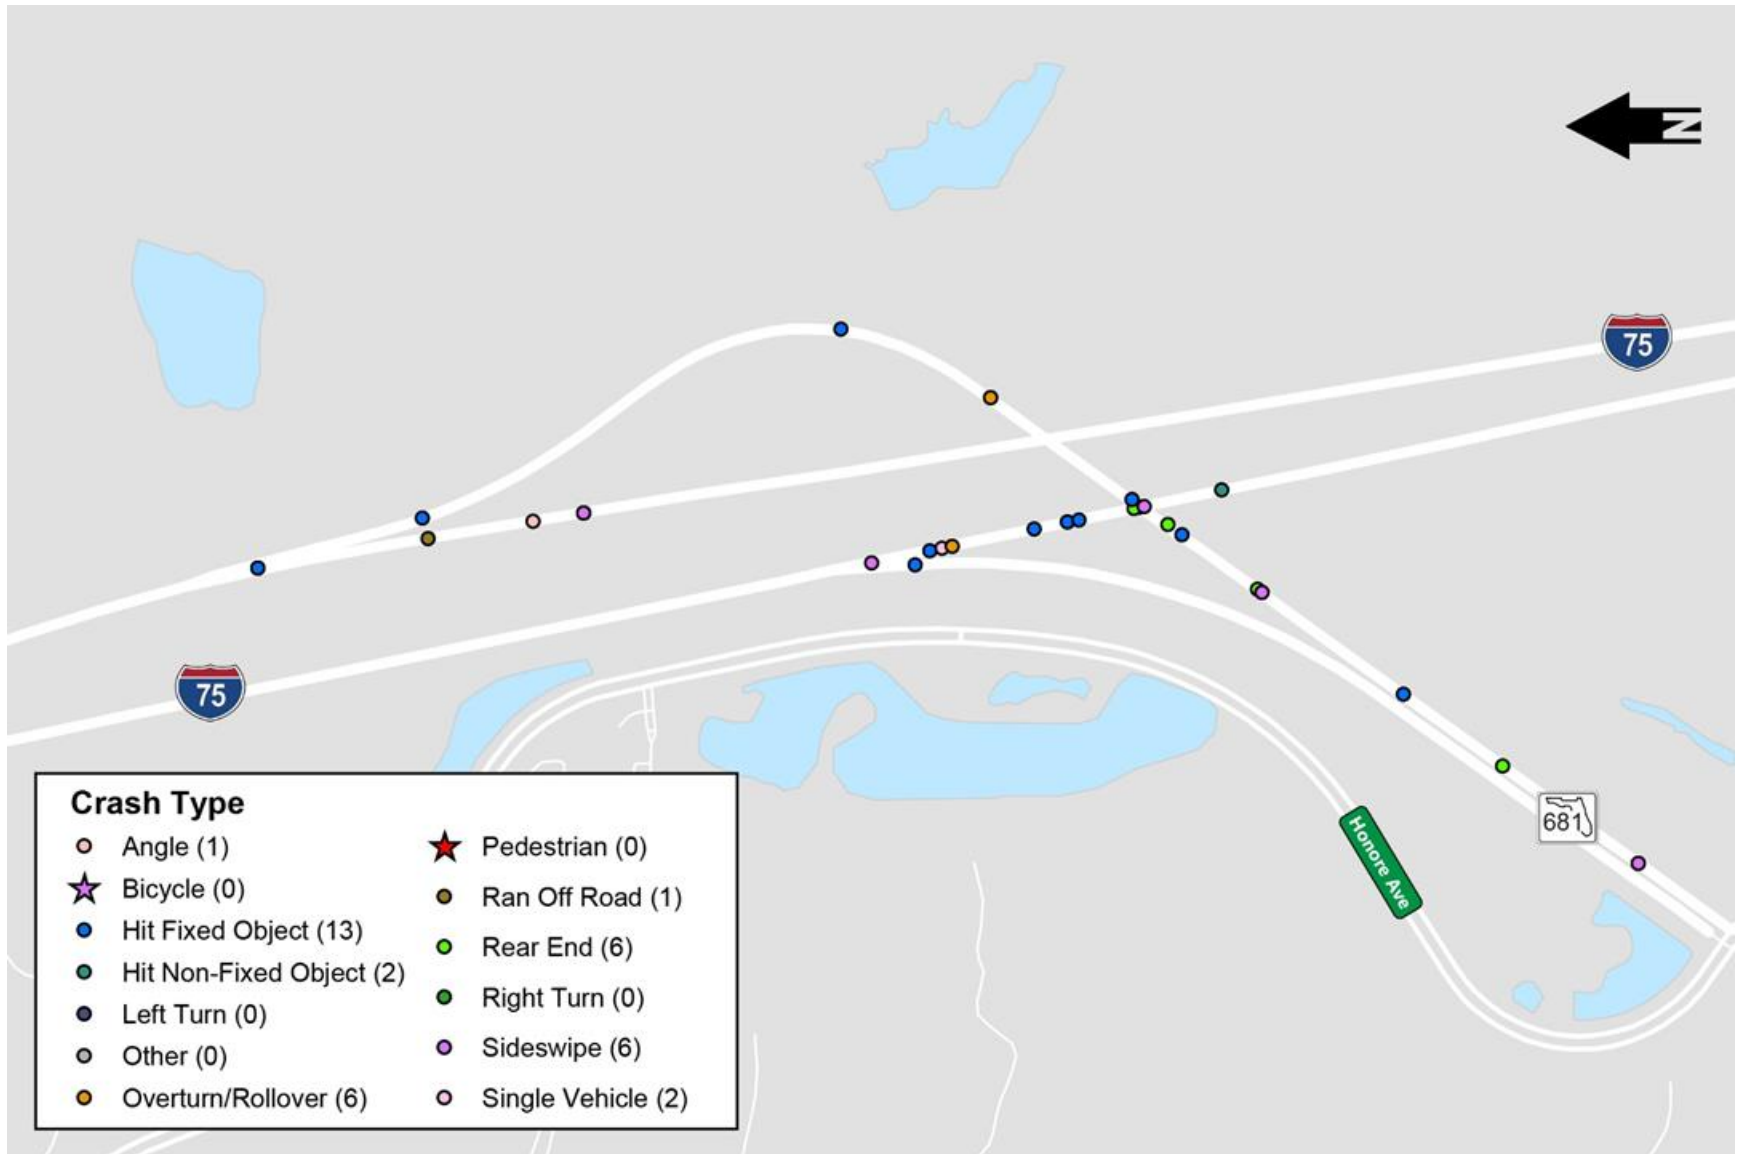

Table 6: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
North of Honore Ave	Hit Fixed Object Overturn/Rollover Rear End	1	25.0%
South of I-75	Hit Fixed Object	5	50.0%

Table 7: Interstate Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

I-75 Off-Ramp			
Off-Ramp from I-75 SB to SR 681 SB	Hit Fixed Object	1	100.0%

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 8** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (75.7 percent) with clear or cloudy weather (78.4 percent) and dry roads (70.3 percent).

Table 8: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Surface Condition								
Dry	6	7	3	6	4	26	5.2	70.3%

Unknown	0	0	0	0	0	0	0.0	0.0%
Total	9	8	7	7	6	37	7.4	100.0%

There are no locations in the study area with 30 or more crashes. Due to the small sample size of crashes at the location level, a breakdown of roadway and lighting conditions by location is not provided.

2.4 Crash Severity

Table 9 summarizes crashes for the study area by severity. Of the 37 total crashes, there were zero fatal crashes, 12 crashes involving personal injury, and 25 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 10**.

Table 9: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	0	0	0.0	0.0%
Severe Injury	2	1	1	0	1	5	1.0	13.5%
Moderate Injury	1	1	0	0	1	3	0.6	8.1%
Minor Injury	1	0	1	1	1	4	0.8	10.8%
Property Damage Only	5	6	5	6	3	25	5.0	67.6%
Total	9	8	7	7	6	37	7.4	100.0%

Table 10: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 11 and **Table 12** summarize crash severity and comprehensive crash cost by location for arterial segments and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were zero fatal crashes, five severe injury crashes, three moderate injury crashes, four minor injury crashes, and 25 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$5,502,474, which is an average of \$1,100,495 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, only SR 681 south of I-75 had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was southbound I-75 at off-ramp to SR 681, with an estimated total five-year crash cost of \$2,185,572. The location with the highest average cost per crash was SR 681 south of I-75, with an average cost per crash of \$217,017.

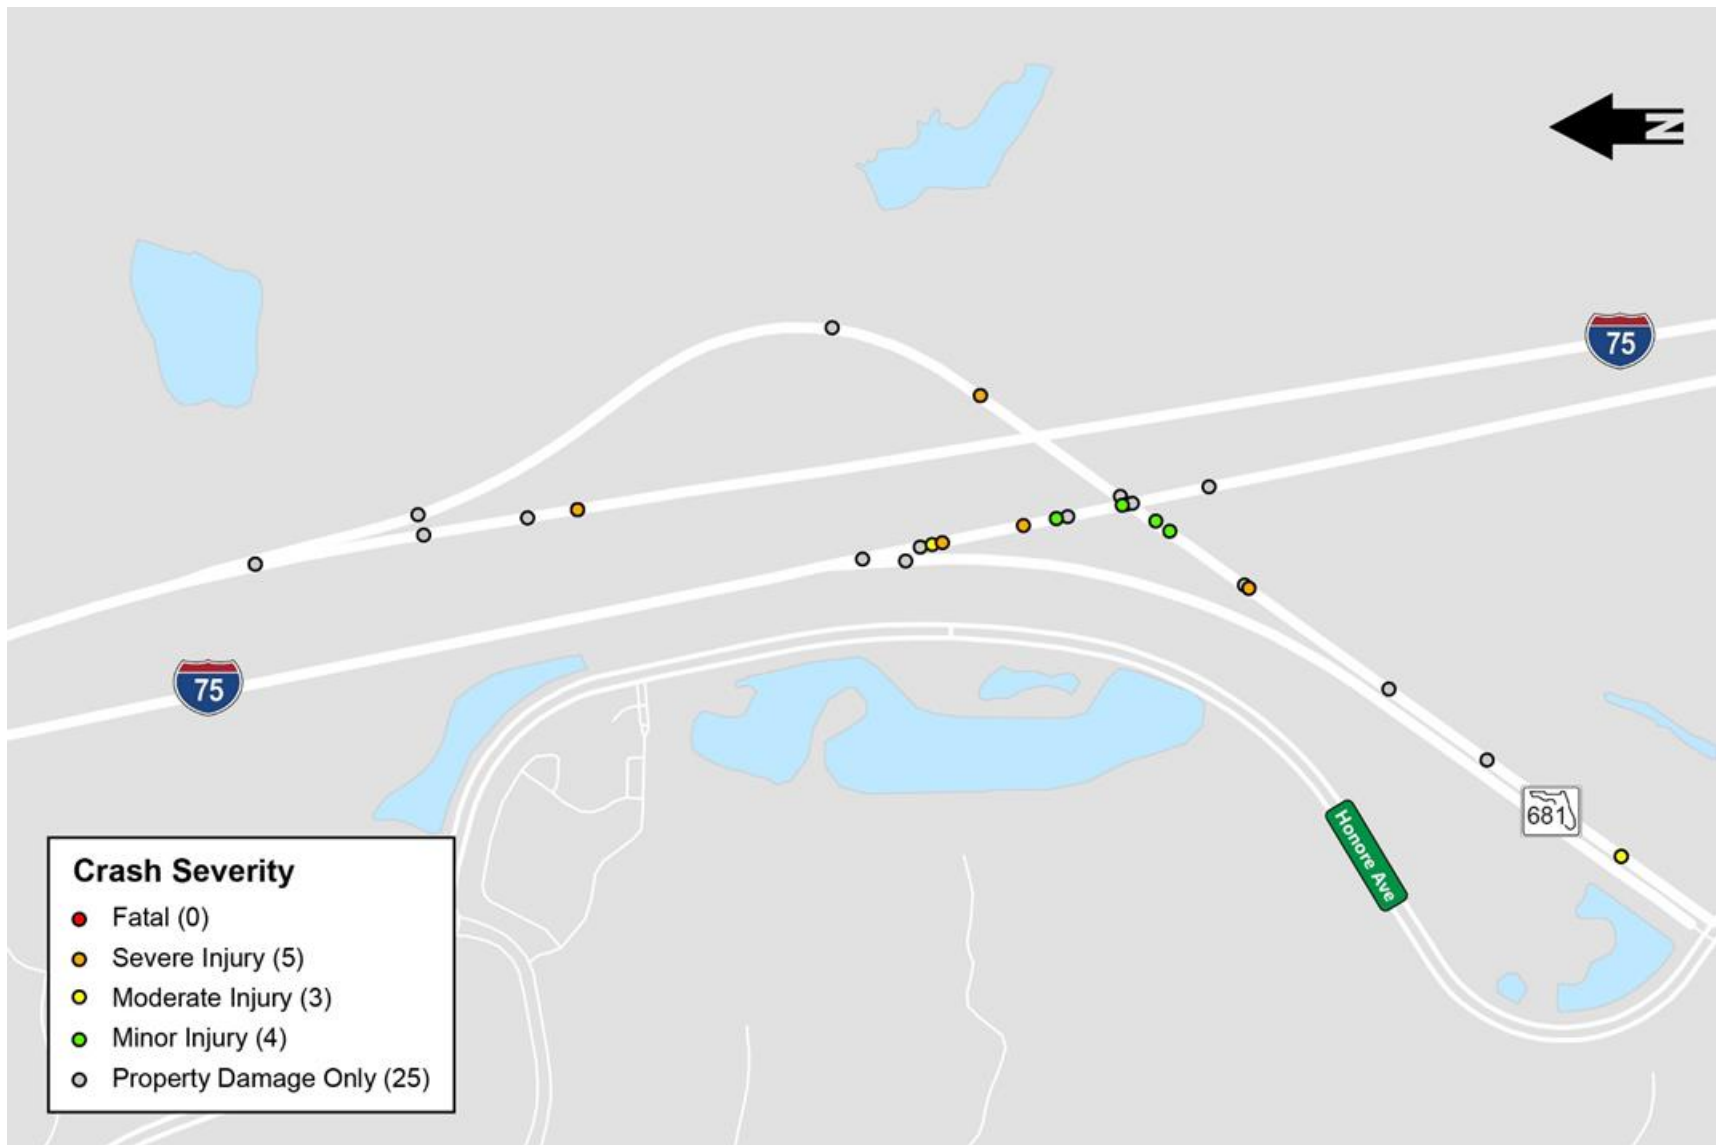

Table 10: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
North of Honore Ave	0	0	1	0	3	4	\$197,118	\$49,280	\$225,315
South of I-75	0	2	1	2	5	10	\$2,170,172	\$217,017	\$159,093
Total Crashes	0	2	2	2	8	14	\$2,367,290	\$169,092

SAFETY MEMORANDUM

Laurel Road at I-75

WPI Segment No.: 442518-2

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes Laurel Road from Twin Laurel Boulevard to Knights Trail Road and I-75 from south of Laurel Road to north of Laurel Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

It is important to note that the construction of the Honore Avenue extension to Laurel Road was completed in 2016. Because this completely changes the intersection geometry and traffic patterns compared to 2013 through 2015, the Laurel Road and Honore Avenue intersection was excluded from the analysis.

Figure 1: Study Area Locations

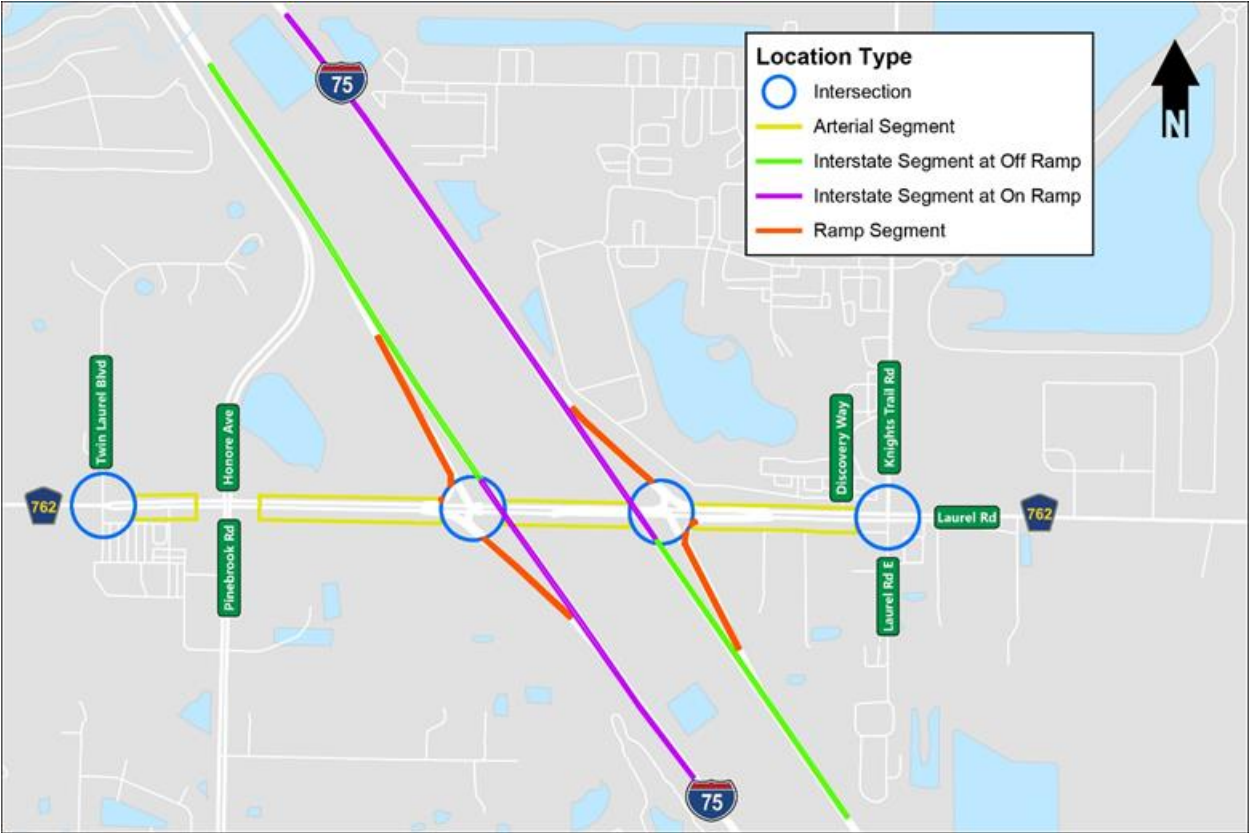

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 108 crashes involving 185 vehicles occurred during the analysis period resulting in two fatalities and 49 injuries. This crash data is included in **Appendix F**. Crashes were closely split among northbound

southbound I-75 segments. The northbound segments accounted for 43 crashes, 76 vehicles, two fatalities, and 17 injuries. The southbound segments accounted for 45 crashes, 74 vehicles, zero fatalities, and 24 injuries.

Crash frequency on northbound I-75 segments increased from 2013 through 2015, and then remained constant through 2017. The southbound I-75 segments witnessed an especially low number of crashes in 2015, as only one crash occurred. However, the number of crashes on southbound I-75 segments increased to 16 in 2017. The remaining three years during the analysis period had a constant crash frequency about 10 per year. Other locations show a very low crash frequency and no obvious trend was found.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. One cluster of crashes is present at Laurel Road at Knights Trail Road and others are present throughout all of the I-75 segments in both directions. However, the scattered presence of crash clusters along I-75 may be due in part to the low overall crash rates along the interstate.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Twin Laurel Blvd to Pinebrook Rd	1	14,300	0.092	0.416	3.634	0.2	0.72%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on arterial intersections and interstate segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. Crash frequency on arterial segments was not high enough to determine the most common crash type. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (78.7 percent) with clear or cloudy weather (83.3 percent) and dry roads (75.9 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

There are no locations in the study area with 30 or more crashes. Due to the small sample size of crashes at the location level, a breakdown of roadway and lighting conditions by location is not provided.

2.4 Crash Severity

Table 11 summarizes crashes for the study area by severity. Of the 108 total crashes, there were 32 crashes involving personal injury, one fatal crash, and 75 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 12**.

Table 11: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	1	0	1	0.2	0.9%
Severe Injury	1	3	2	0	0	6	1.2	5.6%
Moderate Injury	1	3	3	1	7	15	3.0	13.9%
Minor Injury	2	3	2	2	2	11	2.2	10.2%
Property Damage Only	10	13	11	19	22	75	15.0	69.4%
Total	14	22	18	23	31	108	21.6	100.0%

Table 12: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 13, **Table 14**, and **Table 15** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were six severe injury crashes, one fatal crash, 15 moderate injury crashes, 11 minor injury crashes, and 75 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$20,261,807, which is an average of \$4,052,361 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020. This table is included in **Appendix F**. Overall, four locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations are shown in red in the tables below. This location also had an estimated total five-year crash cost of \$12,475,711, which was the highest crash cost out of all locations. The location with the highest average cost per crash was northbound I-75 at off-ramp to Laurel Road, with an average cost per crash of \$623,786.

Table 13: Crash Severity – Arterial

SAFETY MEMORANDUM

Jacaranda Boulevard at I-75

WPI Segment No.: 442518-2

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes Jacaranda Boulevard from Oak Heritage Drive to Commerce Drive and I-75 from west of Jacaranda Boulevard to east of Jacaranda Boulevard as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

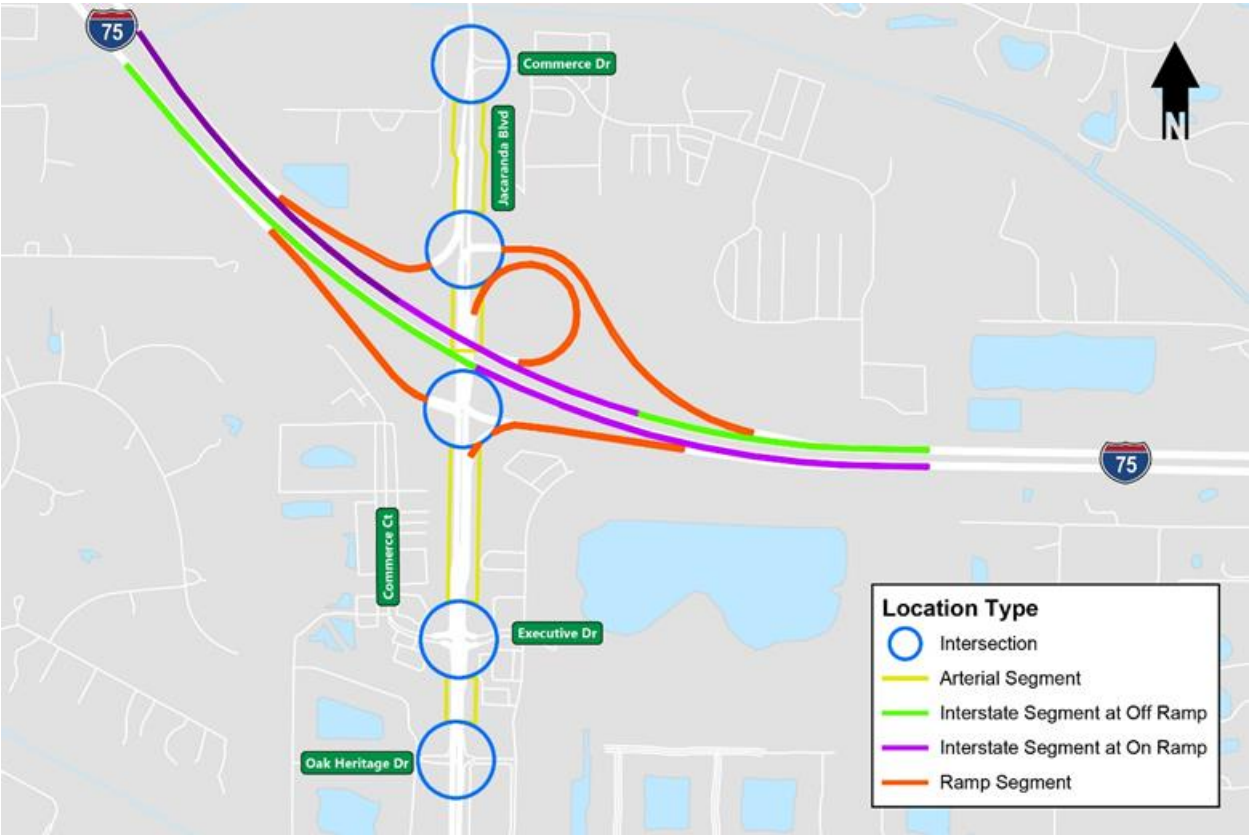

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 215 crashes involving 386 vehicles occurred during the analysis period resulting in four fatalities and 115 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred on I-75 northbound segments and southbound segments. The northbound segments accounted for 84 crashes, 148 vehicles, four fatalities, and 39 injuries. The southbound segments accounted for 68 crashes, 112 vehicles, no fatalities, and 42 injuries.

The location northbound I-75 segments experienced an increasing crash frequency from 2013 through 2015. After this plateau, the crash frequency on I-75 decreased to only seven crashes in 2017. On southbound I-75 segments, crash frequency was low in 2014, which was approximately only half of the other years. It is also worth noting that the crash frequency at intersections on Jacaranda Boulevard shows an increasing frequency from 2013 through 2017, although the overall number is small. Other locations show an overall low number of crashes, and there is no obvious trend.

Table 1: Crash History by Roadway and Year

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. Only the northbound I-75 at off-ramp to Jacaranda Boulevard has a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. The areas of high crash density are Jacaranda Boulevard at Commercial Court / Executive Drive, the northbound I-75 segment just downstream of the off-ramp to Jacaranda Boulevard, and southbound I-75 just upstream of the southbound on-ramp from Jacaranda Boulevard.

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Oak Heritage Dr to Commercial Ct	2	25,600	0.055	0.778	1.730	0.4	5.62%
Commercial Ct to I-75 SB Ramp Terminal	4	25,600	0.191	0.448	1.730	0.8	6.47%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common at arterial intersections and on interstate segments, and sideswipe crashes were the most common on arterial segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. Sideswipe crashes were the most common on arterial segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for sideswipe crashes on roadway segments include inadequate roadway geometry, inadequate shoulders, excessive speed, inadequate pavement markings, and inadequate signing.

Figure 4 shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (77.7 percent) with clear or cloudy weather (82.4 percent) and dry roads (72.6 percent).

Table 10: Crash Conditions Summary

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at on-ramp from Jacaranda Boulevard has both the highest proportion of wet/slick/unpaved and standing water crashes (30 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (16 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 215 total crashes, there were three fatal crashes, 70 crashes involving personal injury, and 142 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	1	0	0	1	3	0.6	1.4%
Severe Injury	3	1	2	5	2	13	2.6	6.0%
Moderate Injury	4	8	13	5	2	32	6.4	14.9%
Minor Injury	4	2	6	10	3	25	5.0	11.6%
Property Damage Only	21	21	34	33	33	142	28.4	66.0%
Total	33	33	55	53	41	215	43.0	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 13 severe injury crashes, 32 moderate injury crashes, 25 minor injury crashes, and 142 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$52,671,307, which is an average of \$10,534,261 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, four locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was northbound I-75 at on-ramp from southbound Jacaranda Boulevard, with an estimated total five-year crash cost of \$33,597,078. The location with the highest average cost per crash was northbound I-75 at on-ramp from southbound Jacaranda Boulevard, with an average cost per crash of \$1,199,896.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

SAFETY MEMORANDUM

North River Road at I-75

WPI Segment No.: 442518-2

Florida Department of Transportation

May 2021

1.0 Historical Crash Data

The study area includes North River Road from East Venice Ave to the end of the roadway north of I-75 northbound ramp terminal and I-75 from west of North River Road to east of North River Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT Crash Analysis Reporting System (CARS) and Signal Four Analytics database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

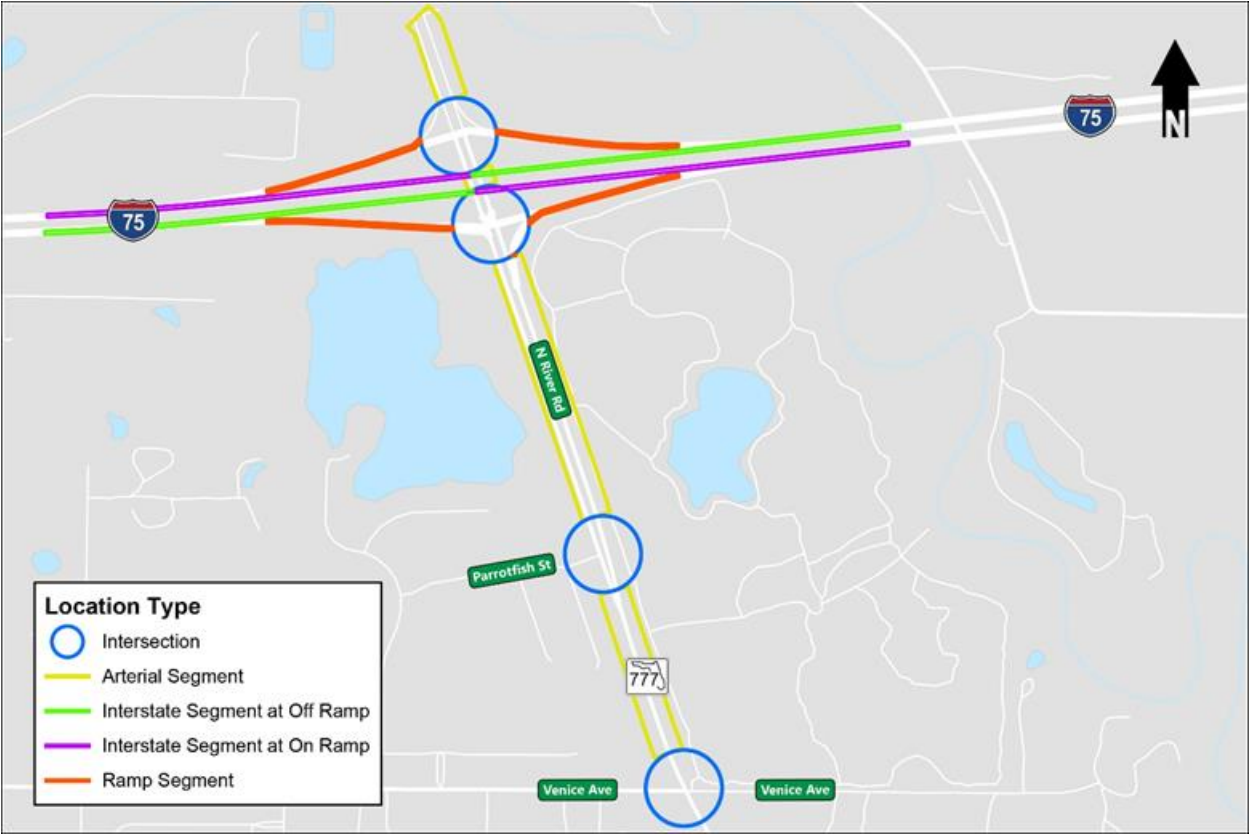

Table 1 summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 210 crashes involving 393 vehicles occurred during the analysis period resulting in two fatalities and 123 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred on southbound I-75 segments, accounting for 112 crashes, 208 vehicles, zero fatalities, and 64 injuries. Crash frequency on southbound I-75 segments increased gradually from 2013 through 2016 but returned to 2013 levels during 2017. Additionally, there are totally 69 crashes occurring on northbound I-75 segment, which is the location having the second largest number of crashes. The crash frequency on it fluctuated

widely from 2013 through 2017, ranging from as low as five crashes per year to as many as 28. Other locations account for few crashes and have a constant crash frequency during the five years.

2.0 Crash Analysis

2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows¹:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

Table 2, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix F**. The following five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher:

- N River Road at East Venice Ave
- I-75 NB at Off-Ramp to North River Road
- I-75 NB at On-Ramp from North River Road
- I-75 SB at Off-Ramp to North River Road
- I-75 SB at On-Ramp from North River Road

Additionally, the four ramp segments connecting the interstate to the arterial locations do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area.

There are several crash clusters on the southbound I-75 segments, including near the east and west end of I-75 segments within the study area along with several clusters between the southbound on-

¹ FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

ramp and off-ramp. On North River Road, the East Venice Avenue intersection also exhibits a notable crash cluster.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
E Venice Ave to Parrotfish St	3	15,900	0.213	0.485	0.768	0.6	11.84%
Parrotfish St to I-75 SB Ramp Terminal	2	15,900	0.339	0.203	1.317	0.4	1.93%
I-75 SB to NB Ramp Terminals	1	15,900	0.022	1.566	1.317	0.2	6.25%

Total	22	38	42	78	30	210	42.0	100.0%

Table 7, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all types of locations. Nevertheless, it is worth noting that the most common crash type is different between northbound and southbound I-75 segments. Northbound segments experienced mostly hit fixed object crashes, while the southbound segment experienced mostly rear end crashes. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. For the hit fixed object crashes, The Highway Safety Manual (HSM) indicates that possible contributing factors include:

- Obstruction in or near roadway
- Inadequate lighting
- Inadequate pavement markings
- Inadequate signs, delineators, or guardrail
- Slippery pavement
- Roadside Design
- Inadequate roadway geometry
- Excessive speed

Figure 4 shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (83.8 percent) with clear or cloudy weather (68.7 percent) and dry roads (61.9 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Surface Condition								
Dry	15	15	25	54	21	130	26.0	61.9%

Total	22	38	42	78	30	210	42.0	100.0%

Table 11 summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at off-ramp to North River Road has both the highest proportion of wet/slick/unpaved and standing water crashes (51 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (12 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %
I-75 Mainline						
I-75 NB at Off-Ramp to N River Rd	38	16	0	42%	3	8%
I-75 NB at On-Ramp from N River Rd	31	15	0	48%	3	10%
I-75 SB at Off-Ramp to N River Rd	51	26	0	51%	6	12%
I-75 SB at On-Ramp from N River Rd	61	15	0	25%	6	10%

2.4 Crash Severity

Table 12 summarizes crashes for the study area by severity. Of the 210 total crashes, there were two fatal crashes, 79 crashes involving personal injury, and 129 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	0	1	0	0	2	0.4	1.0%
Severe Injury	0	2	2	5	2	11	2.2	5.2%
Moderate Injury	0	6	7	7	3	23	4.6	11.0%
Minor Injury	6	7	9	14	9	45	9.0	21.4%
Property Damage Only	15	23	23	52	16	129	25.8	61.4%
Total	22	38	42	78	30	210	42.0	100.0%

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

Table 14, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were two fatal crashes, 11 severe injury crashes, 23 moderate injury crashes, 45 minor injury crashes, and 129 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$40,714,121, which is an average of \$8,142,824 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. This table is included in **Appendix F**. Overall, only the southbound I-75 mainline in the vicinity of the off-ramp to North River Road had a cost per crash higher than the statewide average. The location-specific average cost per crash of this location is shown in red in the tables below. The location with the highest comprehensive crash cost was northbound I-75 at on-ramp from North River Road, with an estimated total five-year crash cost of \$24,352,456. The location with the highest average cost per crash was North River Road between East Venice Avenue and Parrotfish Street, with an average cost per crash of \$296,004. The HSM indicates that wet or slippery roadways may lead to fixed object crashes, and this location exhibits a high proportion of crashes meeting these criteria. It may be the case that these conditions combined with the high posted speed on the roadway are leading to high crash severity at this location as well.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
E Venice Ave to Parrotfish St	0	1	0	0	2	3	\$888,012	\$296,004	\$523,727
Parrotfish St to I-75 SB Ramp Terminal	0	0	0	2	0	2	\$212,430	\$106,215	\$355,183

MCAT Fares

For detailed information on MCAT fares and discount fare eligibility, please see the table on the How To Ride brochure or visit www.mymanatee.org/mcat

	Regular Fare / *Discount Fare	
Cash Fare	Regular Fare / *Discount Fare	\$1.50 / \$0.75
Free Fare Eligible**	Free Fare	Free
M Card 1 Day (unlimited use)	Regular Fare / *Discount Fare	\$4.00 / \$2.00
M Card 7 Day (unlimited use)	Regular Fare / *Discount Fare	\$12.00 / \$6.00
M Card 31 Day (unlimited use)	Regular Fare / *Discount Fare	\$40.00 / \$20.00
R Card 31 Day (SCAT & MCAT unlimited use)	Regular Fare / *Discount Fare	\$60.00 / \$30.00

**Free Fare Eligible: 80 years and up; Children under 5; Anna Maria Island Trolley; Beach Express.

Discount M Card/R Card Eligibility

* To purchase discounted cash fare, M Card or R Card passes, one of the following criteria must apply:

- Must be 60-79 years old
- Mobility Card
- Medicare Card Holder
- Active Duty and Military Veterans
- Enrolled Student at Educational Facility

Regular and Discount M and R Cards are available at MCAT DeSoto and Downtown Transit Stations, by mail order or at ticket outlets. Photo ID and proof of age, disability, veteran status, or student status required for Discount Cards at point of purchase. Regular and Discount 1-Day M Cards may be purchased at DeSoto and Downtown Transit Stations, on a bus or at ticket outlets. When boarding with a Discounted M or R Card, you must show proof of eligibility. **NO EXCEPTIONS.**

Fare Card Outlets

MCAT Sales and Information Offices/Transfer Stations, and Park and Rides

Downtown Bradenton, 601 13th Street West, Bradenton, The Downtown Station is located on 13th St. W. between 8th Ave. and 6th Ave.

 Ride with Us - MCAT

MCAT

ROUTE 1

Ellenton Outlet Mall
Monday - Saturday

Effective Date: December 5, 2020

SERVING

Ellenton Outlet Mall
Palmetto Walmart
Palmetto Station
Downtown Bradenton

How to Ride

- Arrive 10 minutes prior to scheduled time.
- Ensure the driver can see you at the stop.
- Have your fare ready.
- Let the bus operator know if you require additional assistance with riding the bus.
- See the MCAT website for our award-winning "How to Ride" videos or pick up our "How to Ride" brochure for detailed instructions.

MCAT Rider Responsibilities

To provide a quiet, comfortable transportation service, all passengers are expected to comply with certain rules. Failure to follow these rules may result in the police being called, the passenger being asked to leave the bus or bus stop area, and/or the passenger receiving a trespass order from the bus or bus stop area. Refusing to leave the bus or bus stop area when asked makes the person subject to arrest for trespass pursuant to Florida Statute § 810.08. Shirts and shoes are required on all vehicles.

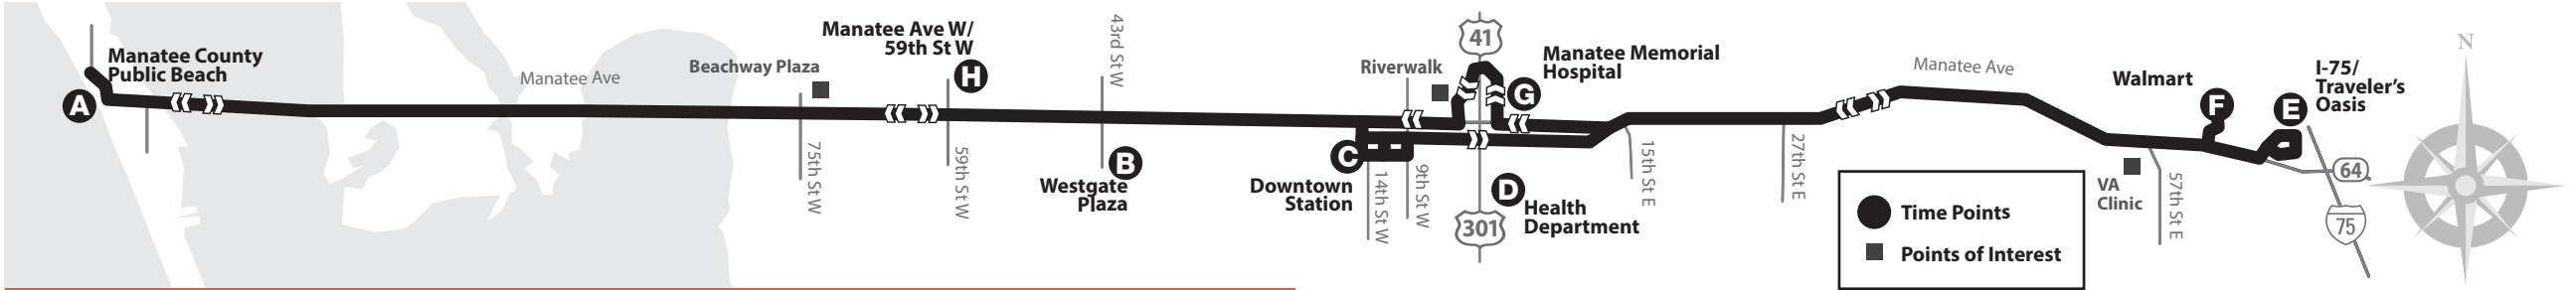

Prohibited on all MCAT buses for safety and courtesy:

- No open food or drink containers.
- No smoking, including electronic cigarettes.
- No weapons.
- No profanity or loud talking.
- No flammable or explosive material.
- No playing personal electronics without personal headphones.
- No alcoholic beverages.
- No electric bikes or scooters.
- No personal items (including strollers) allowed that will block bus aisles.

All Manatee County Area Transit vehicles and facilities are monitored by MCAT, 24 hours 7 days a week using electronic surveillance system and security personnel.

ROUTE 3: Manatee Avenue • Monday - Saturday

Holiday Schedule : Fixed Route and Longboat Key services are not available on New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day.

 Ride with Us - MCAT

MCAT

ROUTE 3

Manatee Avenue
Monday - Saturday

Effective Date: December 5, 2020

SERVING

Walmart/SR 64

VA Office

Manatee Memorial Hospital

Manatee Ave

Beachway Plaza

Manatee County Public Beach

How to Ride

- Arrive 10 minutes prior to scheduled time.
- Ensure the driver can see you at the stop.
- Have your fare ready.
- Let the bus operator know if you require additional assistance with riding the bus.
- See the MCAT website for our award-winning "How to Ride" videos or pick up our "How to Ride" brochure for detailed instructions.

MCAT Rider Responsibilities

To provide a quiet, comfortable transportation service, all passengers are expected to comply with certain rules. Failure to follow these rules may result in the police being called, the passenger being asked to leave the bus or bus stop area, and/or the passenger receiving a trespass order from the bus or bus stop area. Refusing to leave the bus or bus stop area when asked makes the person subject to arrest for trespass pursuant to Florida Statute § 810.08. Shirts and shoes are required on all vehicles.

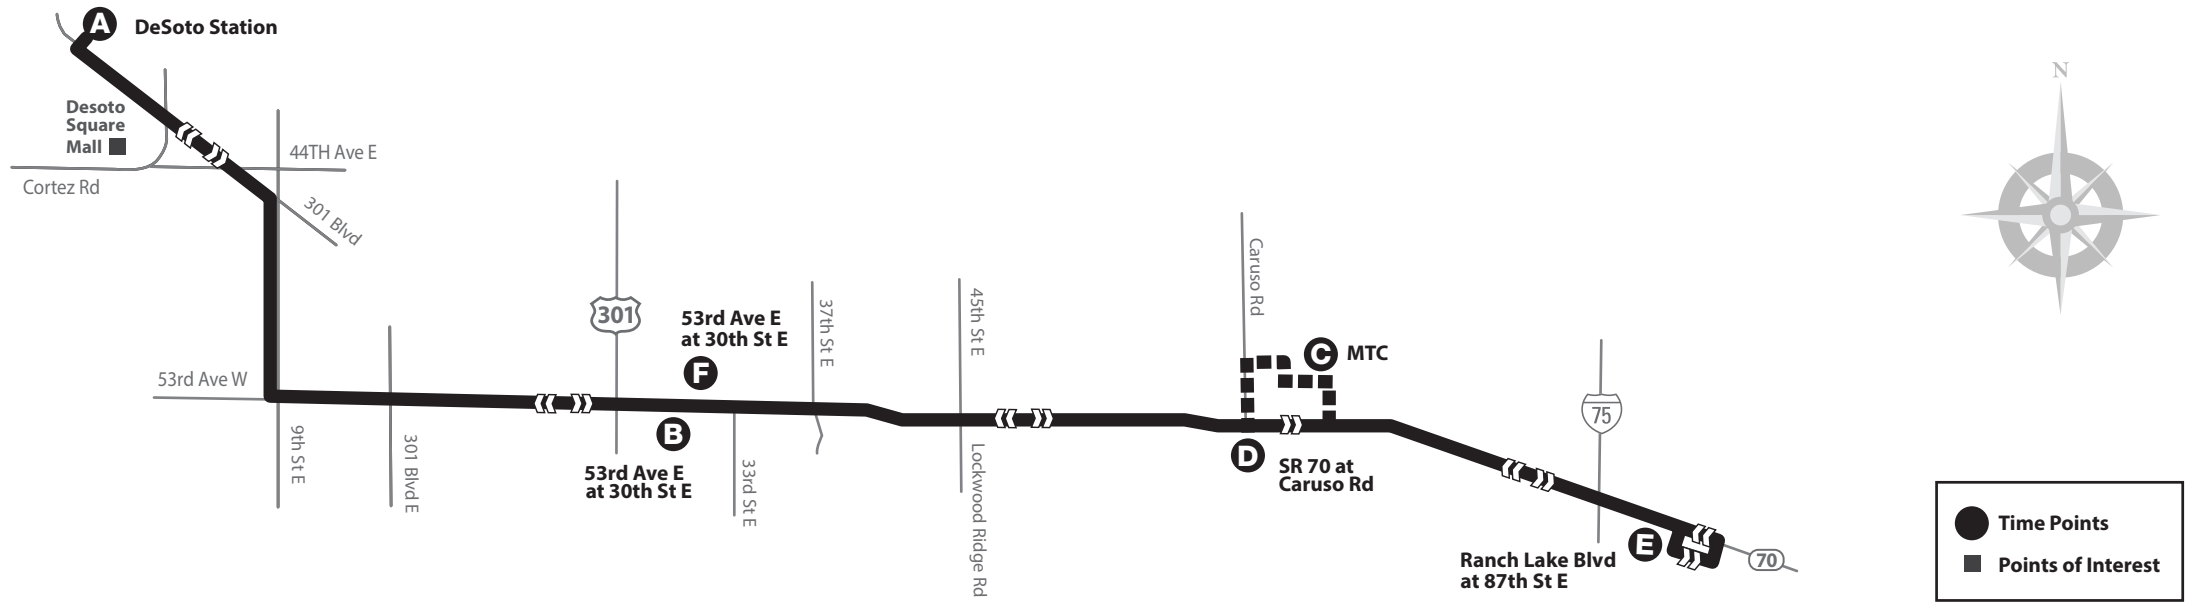

Prohibited on all MCAT buses for safety and courtesy:

- No open food or drink containers.
- No smoking, including electronic cigarettes.
- No weapons.
- No profanity or loud talking.
- No flammable or explosive material.
- No playing personal electronics without personal headphones.
- No alcoholic beverages.
- No electric bikes or scooters.
- No personal items (including strollers) allowed that will block bus aisles.

All Manatee County Area Transit vehicles and facilities are monitored by MCAT, 24 hours 7 days a week using electronic surveillance system and security personnel.

ROUTE 12: State Road 70 • Monday - Saturday

Holiday Schedule : Fixed Route and Longboat Key services are not available on New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day.

Appendix I

Existing Year (2019) Volume Development

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eight 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>	
I-75 & Moccasin Wallow Road NB off Ramp	72-Hour Volume Count
I-75 & Moccasin Wallow Road NB on Ramp	72-Hour Volume Count
I-75 & Moccasin Wallow Road SB off Ramp	72-Hour Volume Count
I-75 & Moccasin Wallow Road SB on Ramp	72-Hour Volume Count
<i>Along Cross Street</i>	
Moccasin Wallow Rd west of Gateway Blvd	72-Hour Volume Count
Moccasin Wallow Rd west of I-75 W Ramps	72-Hour Classification Count
Moccasin Wallow Road west of Buffalo Rd	72-Hour Classification Count
Moccasin Wallow Road west of 69th Ave	72-Hour Volume Count
Moccasin Wallow Road east of 71st Ave	72-Hour Volume Count
<i>Along Side Streets</i>	
69th Ave E south of Moccasin Wallow Rd	72-Hour Volume Count
<i>Intersections</i>	
Moccasin Wallow Road & Gateway Boulevard	TMC
Moccasin Wallow Road & Gillette Road	TMC
I-75 & Moccasin Wallow Road West Ramp Terminal	TMC
I-75 & Moccasin Wallow Road East Ramp Terminal	TMC

Moccasin Wallow Road & 71st Avenue East	TMC
Moccasin Wallow Road & 69th Avenue	TMC

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & Moccasin Wallow Road NB off Ramp	2,509	1.09	0.92	2,516	2,500
I-75 & Moccasin Wallow Road NB on Ramp	6,315	1.09	0.92	6,333	6,300
I-75 & Moccasin Wallow Road SB off Ramp	2,755	1.09	0.92	2,763	2,800
I-75 & Moccasin Wallow Road SB on Ramp	4,800	1.09	0.92	4,813	4,800
Along Cross Street					
Moccasin Wallow Rd west of Gateway Blvd	12,204	1.09	0.92	12,238	12,000
Moccasin Wallow Rd west of I-75 W Ramps	12,220	1.03	N/A	12,587	12,500
Moccasin Wallow Road west of Buffalo Rd	12,570	1.03	N/A	12,947	13,000
Moccasin Wallow Road west of 69th Ave	9,065	1.09	0.92	9,090	9,100
Moccasin Wallow Road east of 71st Ave	8,991	1.09	0.92	9,016	9,000
Along Side Streets					
69th Ave E south of Moccasin Wallow Rd	428	1.09	0.92	429	450

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study

Moccasin Wallow Road

area. During the AM peak hour, the PHF ranges from 0.86 to 0.95 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.93 to 0.95 with a weighted average of 0.94.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Moccasin Wallow Road & Gateway Boulevard	0.86	0.94
Moccasin Wallow Road & Gillette Road	0.95	0.95
I-75 & Moccasin Wallow Road West Ramp Terminal	0.95	0.94
I-75 & Moccasin Wallow Road East Ramp Terminal	0.95	0.93
Moccasin Wallow Road & Buffalo Road	0.91	0.94
Moccasin Wallow Road & 71st Avenue East	0.91	0.95
Average	0.92	0.94

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 9.4 percent. The weighted average of the PM PTD is 9.7 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of existing traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & Moccasin Wallow Road NB off Ramp	2,516	135	5.4%	255	10.1%
I-75 & Moccasin Wallow Road NB on Ramp	6,333	494	7.8%	732	11.6%
I-75 & Moccasin Wallow Road SB off Ramp	2,763	212	7.7%	233	8.4%
I-75 & Moccasin Wallow Road SB on Ramp	4,813	600	12.5%	247	5.1%
Along Cross Street					
Moccasin Wallow Rd west of Gateway Blvd	12,238	1,056	8.6%	1,166	9.5%
Moccasin Wallow Rd west of I-75 W Ramps	12,587	1,165	9.3%	1,481	11.8%
Moccasin Wallow Road west of Buffalo Road	12,947	1,169	9.0%	1,192	9.2%
Moccasin Wallow Road west of 69th Ave	9,090	961	10.6%	763	8.4%
Moccasin Wallow Road east of 71st Ave	9,016	897	9.9%	691	7.7%
Along Side Streets					
69th Ave E south of Moccasin Wallow Rd	429	26	6.1%	44	10.3%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 62.4 percent to 68.3 percent during the AM peak hour along the cross street, with a westbound peak direction east of I-75 and an eastbound peak direction west of I-75. During the PM peak hour the D factors ranged from 57.2 percent to 78.0 percent along the cross street, with an eastbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Moccasin Wallow Rd west of Gateway Blvd	719	337	68.1%	67.4%	East
Moccasin Wallow Rd west of I-75 W Ramps	764	401	65.6%	65.7%	East
Moccasin Wallow Road west of Buffalo Road	358	811	69.4%	68.3%	West
Moccasin Wallow Road west of 69th Ave	345	616	64.1%	65.7%	West
Moccasin Wallow Road east of 71st Ave	345	552	61.5%	62.4%	West
Along Side Streets					
69th Ave E south of Moccasin Wallow Rd	10	16	61.5%	60.0%	South

*Resulting D Factor after volume balancing procedures were conducted.

Moccasin Wallow Road

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Moccasin Wallow Road west of Buffalo Road	610	582	51.2%	60.3%	East
Moccasin Wallow Rd west of I-75 W Ramps	1,147	334	77.4%	77.5%	East
Moccasin Wallow Rd west of Gateway Blvd	911	255	78.1%	78.0%	East
Moccasin Wallow Road west of 69th Ave	446	317	58.5%	59.9%	East
Moccasin Wallow Road east of 71st Ave	388	303	56.2%	57.2%	East
Along Side Streets					
69th Ave E south of Moccasin Wallow Rd	8	36	81.8%	95.7%	South

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceeded the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
Moccasin Wallow Rd west of I-75 W Ramps	14,676	1,186	8.1%	667	4.5%	1,853	12.6%
Moccasin Wallow Road west of Buffalo Road	12,920	1,073	8.3%	491	3.8%	1,564	12.1%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp	137054	1900	11.5%	2500	13.9%	2600	8.3%
I-75 Southbound On-Ramp	137052	3700	7.3%	3900	7.4%	4000	6.4%
I-75 Northbound On-Ramp	137053	2000	11.5%	2500	13.9%	2600	8.3%
I-75 Northbound Off-Ramp	137051	3600	7.3%	3800	7.4%	3900	6.4%
Moccasin Wallow Rd, west of Buffalo Road	134020	13600	14.3%	14000	17.4%	15000	17.4%
Moccasin Wallow Rd, east of Ellenton Gillette	131006	4900	14.3%	5300	17.4%	5500	17.4%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification

Moccasin Wallow Road

count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	130754/137053	13.9%	7.0%
Cross Street	72-Hour Classification Count	12.6%	7.0%
Side Streets		12.6%	7.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, six 72-hour bi-directional volume counts, and four turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-275 Ramps</i>	
I-275 & US 41 Westbound off Ramp	72-Hour Volume Count
I-275 & US 41 Westbound on Ramp	72-Hour Volume Count
I 275 & US 41 Eastbound off Ramp	72-Hour Volume Count

US 41 & 85th Street	TMC

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-275 & US 41 Westbound off Ramp	7,758	1.05	0.93	7,576	7,600
I-275 & US 41 Westbound on Ramp	3,265	1.05	0.93	3,188	3,200
I 275 & US 41 Eastbound off Ramp	6,375	1.05	0.93	6,225	6,200
I 275 & US 41 Eastbound on Ramp	3,655	1.05	0.93	3,569	3,600
Along Cross Street					
US 41 south of I-275 Eastbound Ramps	27,180	1	N/A	27,180	27,000
US 41 north of I-275 Westbound Ramps	24,298	1.05	N/A	25,513	25,500
US 41 South of 73rd Street	25,981	1.05	0.93	25,370	25,500
US 41 North of 85th Street	23,048	1.05	0.93	22,506	22,500

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the four intersections in the study area. During the AM peak hour, the PHF ranges from 0.89 to 0.91 with a weighted average of 0.90. During the PM peak hour, the PHF ranges from 0.95 to 0.97 with a weighted average of 0.96.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
US 41 & 73rd Street	0.89	0.96
US 41 & I-275 Eastbound Ramp Terminal	0.91	0.95
US 41 & I-275 Westbound Ramp Terminal	0.91	0.97
US 41 & 85th Street	0.91	0.96
Average	0.90	0.96

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.8 percent. The weighted average of the PM PTD is 9.3 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-275 & US 41 Westbound off Ramp	7,576	504	6.7%	520	6.9%
I-275 & US 41 Westbound on Ramp	3,188	407	12.8%	157	4.9%
I 275 & US 41 Eastbound off Ramp	6,225	302	4.9%	924	14.8%
I 275 & US 41 Eastbound on Ramp	3,569	395	11.1%	236	6.6%
Along Cross Street					
US 41 south of I-275 Eastbound Ramps	27,180	1,973	7.3%	2,290	8.4%
US 41 north of I-275 Westbound Ramps	25,513	1,931	7.6%	2,646	10.4%
US 41 South of 73rd Street	25,370	1,743	6.9%	2,084	8.2%
US 41 North of 85th Street	22,506	1,695	7.5%	2,289	10.2%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 50.1 percent to 64.1 percent during the AM peak hour along the cross street, with a peak direction of south throughout. During the PM peak hour the D factors ranged from 52.9 percent to 76.2 percent along the cross street, with a northbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
US 41 south of I-275 Eastbound Ramps	867	1,106	56.1%	51.0%	South
US 41 north of I-275 Westbound Ramps	1,012	919	52.4%	64.1%	South
US 41 South of 73rd Street	753	990	56.8%	61.2%	South
US 41 North of 85th Street	899	796	53.0%	50.1%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
US 41 south of I-275 Eastbound Ramps	1,061	1,229	53.7%	52.9%	North
US 41 north of I-275 Westbound Ramps	1,993	653	75.3%	63.7%	North
US 41 South of 73rd Street	1,256	828	60.3%	60.0%	North
US 41 North of 85th Street	1,711	578	74.7%	76.2%	South

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
US 41 south of I-275 Eastbound Ramps	27,076	1,711	6.3%	640	2.4%	2,351	8.7%
US 41 north of I-275 Westbound Ramps	27,462	2,316	8.4%	764	2.8%	3,080	11.2%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound, Off-Ramp to I-275	137044	7300	7.3	7700	7.4	7900	6.4
I-75 Northbound, On-Ramp from I-275	137043	8600	7.3	9100	7.4	9400	6.4
I-75 Northbound, Off-Ramp To I-275	137041	17500	7.9	17000	7.9	17500	6.4
I-75 Northbound, On-Ramp from I-275	137042	19000	7.3	18000	7.4	18500	6.4
I-275 Southbound, Off-Ramp to SR 41	137104	3000	8.0	2900	8.2	3000	7.8
I-275 Southbound, On-Ramp from SR 41	137103	3000	8.0	2800	8.2	2900	7.8
I-275 Northbound, Off-Ramp to SR 41	137101	8200	9.7	7400	10.2	7600	8.3
I-275 Northbound, On-Ramp from SR 41	137102	8500	9.7	8000	10.2	8200	8.3

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	137101/137102	10.2%	6.0%
Cross Street	72-Hour Classification Count	11.2%	6.0%
Side Streets		11.2%	6.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eight 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>	
I-75 & US 301 Southbound loop on Ramp	72-Hour Volume Count
I-75 & US 301 Southbound off Ramp	72-Hour Volume Count
I-75 & US 301 Northbound loop off Ramp	72-Hour Volume Count
I-75 & US 301 Northbound on Ramp	72-Hour Volume Count
<i>Along Cross Street</i>

US 301 east of I-75 NB Ramp Terminal	72-Hour Classification Count
US 301 west of 51st Avenue	72-Hour Volume Count
US 301 east of 60th Avenue	72-Hour Volume Count
US 301 east of 18th Street	72-Hour Volume Count
<i>Along Side Streets</i>	
McDonalds Driveway South of US 301	72-Hour Volume Count
<i>Intersections</i>	
US 301 & 51st Avenue	TMC
US 301 & I-75 Southbound Ramp Terminal	TMC
US 301 & I-75 Northbound Ramp Terminal	TMC
US 301 & 60th Avenue	TMC
US 301 & K-Mart Driveway	TMC
US 301 & 18th Street	TMC
US 301 & McDonalds Driveway	TMC

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & US 301 Southbound loop on Ramp	14,648	1.06	0.97	15,061	15,000
I-75 & US 301 Southbound off Ramp	6,119	1.06	0.97	6,292	6,300
I-75 & US 301 Northbound loop off Ramp	14,555	1.06	0.97	14,965	15,000
I-75 & US 301 Northbound on Ramp	6,615	1.06	0.97	6,802	6,800
Along Cross Street					
US 301 west of I-75 SB Ramp Terminal	39,918	1.06	N/A	42,313	42,500
US 301 east of I-75 NB Ramp Terminal	46,650	1.06	N/A	49,449	49,500
US 301 west of 51st Avenue	34,315	1.06	0.97	35,283	35,500
US 301 east of 60th Avenue	38,031	1.06	0.97	39,103	39,000
US 301 east of 18th Street	36,270	1.06	0.97	37,293	37,500
Along Side Streets					
McDonalds Driveway South of US 301	3,292	1.06	0.97	3,385	3,400

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study

area. During the AM peak hour, the PHF ranges from 0.95 to 0.98 with a weighted average of 0.97. During the PM peak hour, the PHF ranges from 0.93 to 0.95 with a weighted average of 0.94.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
US 301 & 51st Avenue	0.98	0.95
US 301 & I-75 Southbound Ramp Terminal	0.95	0.93
US 301 & I-75 Northbound Ramp Terminal	0.98	0.94
US 301 & 60th Avenue	0.97	0.95
US 301 & K-Mart Driveway	0.96	0.94
US 301 & 18th Street	0.97	0.93
Average	0.97	0.94

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.3 percent. The weighted average of the PM PTD is 8.8 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & US 301 Southbound loop on Ramp	15,061	1,390	9.2%	1,056	7.0%
I-75 & US 301 Southbound off Ramp	6,292	426	6.8%	529	8.4%
I-75 & US 301 Northbound loop off Ramp	14,965	840	5.6%	1,589	10.6%
I-75 & US 301 Northbound on Ramp	6,802	399	5.9%	520	7.6%
Along Cross Street					
US 301 west of I-75 SB Ramp Terminal	42,313	2,965	7.0%	3,589	8.5%
US 301 east of I-75 NB Ramp Terminal	49,449	3,140	6.3%	3,873	7.8%
US 301 west of 51st Avenue	35,283	2,514	7.1%	2,947	8.4%
US 301 east of 60th Avenue	39,103	2,543	6.5%	3,191	8.2%
US 301 east of 18th Street	37,293	2,443	6.6%	3,139	8.4%
Along Side Streets					
McDonalds Driveway South of US 301	3,385	174	5.1%	231	6.8%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 50.3 percent to 62.9 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors ranged from 51.1 percent to 76.1 percent along the cross street, with an eastbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
US 301 west of I-75 SB Ramp Terminal	1,262	1,703	57.4%	50.3%	West
US 301 east of I-75 NB Ramp Terminal	1,107	2,033	64.7%	55.5%	West
US 301 west of 51st Avenue	1,014	1,500	59.7%	59.5%	West
US 301 east of 60th Avenue	899	1,644	64.6%	61.3%	West
US 301 east of 18th Street	849	1,594	65.2%	62.9%	West
Along Side Streets					
McDonalds Driveway South of US 301	81	93	53.4%	52.0%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
US 301 west of I-75 SB Ramp Terminal	2,080	1,509	58.0%	76.1%	East
US 301 east of I-75 NB Ramp Terminal	2,350	1,523	60.7%	51.1%	East
US 301 west of 51st Avenue	1,755	1,192	59.6%	59.8%	East
US 301 east of 60th Avenue	1,938	1,253	60.7%	63.8%	East
US 301 east of 18th Street	1,972	1,167	62.8%	63.7%	East
Along Side Streets					
McDonalds Driveway South of US 301	111	120	51.9%	55.4%	South

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceeded the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
US 301 west of I-75 SB Ramp Terminal	42,313	2,626	6.2%	916	2.2%	3,542	8.4%
US 301 east of I-75 NB Ramp Terminal	49,449	2,561	5.2%	265	0.5%	2,826	5.7%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to US 301	137034	5500	6.4%	5300	7.4%	5900	7.3%
I-75 Northbound On-Ramp from US 301	137033	5600	6.4%	5400	7.4%	5800	7.3%
I-75 Southbound On-Ramp from US 301	137032	17500	7.3%	15000	7.4%	15500	6.4%
I-75 Northbound Off-Ramp to US 301	137031	17500	7.3%	14500	7.4%	15000	6.4%
US 301, East of I-75	130052	40000	5.1%	39500	4.1%	39000	4.7%
US 301, West of I-75	130180	30788	5.8%	32056	6.2%	33859	6.1%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	137032/137033/137034	7.4%	4.0%
Cross Street	72-Hour Classification Count	8.4%	5.0%
Side Streets		8.4%	5.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, seven 72-hour bi-directional volume counts, and six turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75/SR 64 Southbound on Ramp	8,613	1.03	0.97	8,605	8,600
I-75 & SR 64 Southbound loop on Ramp	6,556	1.05	0.98	6,746	6,700
I-75 & SR 64 Southbound off Ramp	12,635	1.05	0.98	13,001	13,000
I-75 & SR 64 Northbound off Ramp	14,934	1.05	0.98	15,367	15,500
I-75/SR 64 Northbound on Ramp	12,655	1.03	0.97	12,644	12,500
Along Cross Street					
SR 64 west of I-75 SB Ramps	51,206	1.05	N/A	53,766	54,000
SR 64 east of I-75 Northbound Ramps	54,739	1.03	N/A	56,381	56,500
SR 64 west of 62nd Street	51,144	1.03	0.97	51,098	51,000
SR 64 west of 66th Street	43,418	1.05	0.98	44,677	44,500
SR 64 east of Grand Harbour Parkway	44,858	1.05	0.98	46,159	46,000
SR 64 west of I-75 SB Ramps	51,206	1.05	N/A	53,766	54,000
SR 64 east of I-75 Northbound Ramps	54,739	1.03	N/A	56,381	56,500

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study area. During the AM peak hour, the PHF ranges from 0.94 to 0.97 with a weighted average of 0.95. During the PM peak hour, the PHF ranges from 0.91 to 0.95 with a weighted average of 0.92.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 64 & Kay Street	0.95	0.91
SR 64 & 65th Street	0.94	0.91
SR 64 & 66th Street	0.94	0.93
SR 64 & I-75 Southbound Ramp Terminal	0.93	0.91
SR 64 & I-75 Northbound Ramp Terminal	0.97	0.93
SR 64 & Grand Harbour Parkway	0.97	0.95
Average	0.95	0.92

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.1 percent. The weighted average of the PM PTD is 8.6 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<i>I-75 Ramps</i>					
I-75/SR 64 Southbound on Ramp	8,605	582	6.8%	670	7.8%
I-75 & SR 64 Southbound loop on Ramp	6,746	552	8.2%	402	6.0%
I-75 & SR 64 Southbound off Ramp	13,001	1,161	8.9%	1,056	8.1%
I-75 & SR 64 Northbound off Ramp	15,367	1,014	6.6%	1,136	7.4%
I-75/SR 64 Northbound on Ramp	12,644	847	6.7%	1,107	8.8%
<i>Along Cross Street</i>					
SR 64 west of I-75 SB Ramps	53,766	4,913	9.1%	5,064	9.4%
SR 64 east of I-75 Northbound Ramps	56,381	4,471	7.9%	4,701	8.3%
SR 64 west of 62nd Street	51,098	3,789	7.4%	4,332	8.5%
SR 64 west of 66th Street	44,677	3,808	8.5%	4,096	9.2%
SR 64 east of Grand Harbour Parkway	46,159	3,840	8.3%	3,902	8.5%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 52.5 percent to 56.0 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors from 51.4 percent to 54.2 percent along the cross street, with an eastbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<i>Along Cross Street</i>					
SR 64 west of I-75 SB Ramps	2,182	2,731	55.6%	54.7%	West
SR 64 east of I-75 Northbound Ramps	2,069	2,402	53.7%	52.5%	West
SR 64 west of 62nd Street	1,751	2,038	53.8%	56.0%	West
SR 64 west of 66th Street	1,930	1,878	50.7%	55.3%	East
SR 64 east of Grand Harbour Parkway	1,811	2,029	52.8%	52.9%	West

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 64 west of I-75 SB Ramps	2,645	2,419	52.2%	52.4%	East
SR 64 east of I-75 Northbound Ramps	2,569	2,132	54.6%	54.2%	East
SR 64 west of 62nd Street	2,539	1,793	58.6%	52.7%	East
SR 64 west of 66th Street	2,336	1,760	57.0%	51.4%	West
SR 64 east of Grand Harbour Parkway	2,057	1,845	52.7%	52.4%	East

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceeded the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period.

Table 2.6 summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
SR 64 west of I-75 SB Ramps	59,659	2,893	4.8%	597	1.0%	3,490	5.8%
SR 64 east of I-75 Northbound Ramps	56,381	3,587	6.4%	434	0.8%	4,021	7.1%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	137026/137025/137024	7.4%	4.0%
Cross Street	72-Hour Classification Count	7.1%	4.0%
Side Streets		7.1%	4.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, seven 72-hour bi-directional volume counts, and nine turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & SR 70 Southbound on Ramp	9,552	0.98	0.96	8,987	9,000
I-75 & SR 70 Southbound loop on Ramp	6,268	0.98	0.96	5,897	5,900
I-75 & SR 70 Southbound off Ramp	13,905	0.98	0.96	13,082	13,000
I-75 & SR 70 Northbound off Ramp	11,363	0.98	0.96	10,690	10,500
I-75 & SR 70 Northbound on Ramp	10,778	0.98	0.96	10,140	10,000
Along Cross Street					
SR 70 west of Creekwood boulevard	52,747	1.01	N/A	53,274	53,500
SR 70 east of Braden Run	38,626	1.01	N/A	39,012	39,000
SR 70 west of I-75 SB Ramps	48,551	0.98	0.96	45,677	45,500
SR 70 east of I-75 NB Ramps	57,121	0.98	0.96	53,739	53,500
SR 70 west of Creekwood boulevard	52,747	1.01	N/A	53,274	53,500
SR 70 east of Braden Run	38,626	1.01	N/A	39,012	39,000

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the eight intersections in the

study area. During the AM peak hour, the PHF ranges from 0.81 to 0.97 with a weighted average of 0.91. During the PM peak hour, the PHF ranges from 0.92 to 0.98 with a weighted average of 0.95.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 70 & Creekwood Boulevard	0.96	0.98
SR 70 & 73rd Lane	0.97	0.96
SR 70 & I-75 Southbound Ramps	0.96	0.93
SR 70 & I-75 Northbound Ramps	0.96	0.97
SR 70 & Lena Road	0.94	0.98
SR 70 & 87th Street	0.92	0.97
Tara Boulevard & 55th Avenue	0.81	0.92
Creekwood Boulevard & 52nd Place	0.91	0.95
Average	0.91	0.95

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.9 percent. The weighted average of the PM PTD is 8.5 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & SR 70 Southbound on Ramp	8,987	896	10.0%	566	6.3%
I-75 & SR 70 Southbound loop on Ramp	5,897	409	6.9%	474	8.0%
I-75 & SR 70 Southbound off Ramp	13,082	947	7.2%	873	6.7%
I-75 & SR 70 Northbound off Ramp	10,690	953	8.9%	992	9.3%
I-75 & SR 70 Northbound on Ramp	10,140	875	8.6%	1,070	10.6%
Along Cross Street					
SR 70 west of Creekwood boulevard	53,274	4,113	7.7%	4,657	8.7%
SR 70 east of Braden Run	39,012	3,112	8.0%	3,551	9.1%
SR 70 west of I-75 SB Ramps	45,677	3,481	7.6%	3,857	8.4%
SR 70 east of I-75 NB Ramps	53,739	4,077	7.6%	4,340	8.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 50.9 percent to 57.1 percent during the AM peak hour along the cross street, with a peak direction of east for the segment between west of I-75 SB ramps and east of I-75 NB ramps. During the PM peak hour the D factors ranged from 50.1 percent to 58.5 percent along the cross street, with a peak direction of east throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 70 west of Creekwood boulevard	2,034	2,079	50.5%	57.1%	West
SR 70 east of Braden Run	1,749	1,363	56.2%	50.9%	West
SR 70 west of I-75 SB Ramps	1,383	2,098	60.3%	54.5%	East
SR 70 east of I-75 NB Ramps	2,005	2,072	50.8%	52.1%	East

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 70 west of Creekwood boulevard	2,308	2,349	50.4%	58.5%	East
SR 70 east of Braden Run	2,226	1,325	62.7%	50.2%	West
SR 70 west of I-75 SB Ramps	1,537	2,320	60.2%	52.1%	East
SR 70 east of I-75 NB Ramps	2,087	2,253	51.9%	50.1%	East

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
SR 70 west of Creekwood boulevard	57,190	3,939	6.9%	780	1.4%	4,719	8.3%
SR 70 east of Braden Run	44,358	2,563	5.8%	1,026	2.3%	3,589	8.1%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to SR 70	137016	14000	7.3%	12500	7.4%	13000	6.4%
I-75 Northbound On-Ramp from SR 70	137015	14000	7.3%	12500	7.4%	13000	6.4%
I-75 Southbound loop On-Ramp from SR 70	137014	6600	-	7400	7.0%	7600	7.1%
I-75 Southbound On-Ramp from SR 70	137012	10500	-	9200	7.0%	7500	7.1%
I-75 Northbound Off-Ramp to SR 70	137011	7200	-	7900	7.0%	8100	7.1%
SR 70, East of I-75	130048	47500	5.4%	46500	5.6%	45500	6.0%
SR 60, West of I-75	130047	60500	6.1%	61000	5.7%	61000	5.7%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	137015/137016	7.4%	4.0%
Cross Street	72-Hour Classification Count	8.3%	5.0%
Side Streets		8.3%	5.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eight 72-hour bi-directional volume counts, and eight turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & University Parkway SB off Ramp	15,516	1.15	0.97	17,308	17,500
I-75 & University Parkway SB on Ramp	19,784	1.15	0.97	22,069	22,000
I-75 & University Parkway NB off Ramp	18,764	1.15	0.97	20,931	21,000
I-75 & University Parkway NB on Ramp	15,553	1.15	0.97	17,349	17,500
Along Cross Street					
University Parkway west of Cooper Creed	61,031	1.03	N/A	62,862	63,000
University Parkway east of Market Street	34,742	1.03	N/A	35,784	36,000
University Parkway west of I-75 SB Ramps	58,838	1.15	0.97	65,634	65,500
University Pkwy east of I-75 NB Ramps	44,478	1.15	0.97	49,615	49,500
University Pkwy east of Town Center Pkwy	27,802	1.15	0.97	31,013	31,000

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the eight intersections in the study area. During the AM peak hour, the PHF ranges from 0.87 to 0.93 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.91 to 0.98 with a weighted average of 0.94.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
University Parkway & Cooper Creek Boulevard	0.93	0.97
University Parkway & I-75 SB Ramp Terminal	0.93	0.98
University Parkway & I-75 NB Ramp Terminal	0.93	0.92
University Parkway & Market Street	0.92	0.91
University Parkway & Lawrence Building Driveway	0.91	0.94
University Parkway & Town Center Parkway	0.92	0.95
Cooper Creek Boulevard & University Town Center Drive	0.87	0.93
Cooper Creek Boulevard & Tourist Center Drive	0.92	0.92
Average	0.92	0.94

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.7 percent. The weighted average of the PM PTD is 9.2 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & University Parkway SB off Ramp	17,308	1,349	7.8%	1,181	6.8%
I-75 & University Parkway SB on Ramp	22,069	1,997	9.0%	2,011	9.1%
I-75 & University Parkway NB off Ramp	20,931	2,214	10.6%	1,793	8.6%
I-75 & University Parkway NB on Ramp	17,349	774	4.5%	1,761	10.2%
Along Cross Street					
University Parkway west of Cooper Creed	62,862	4,228	6.7%	4,758	7.6%
University Parkway east of Market Street	35,784	3,515	9.8%	3,619	10.1%
University Parkway west of I-75 SB Ramps	65,634	4,706	7.2%	5,488	8.4%
University Pkwy east of I-75 NB Ramps	49,615	5,060	10.2%	5,168	10.4%
University Pkwy east of Town Center Pkwy	31,013	3,160	10.2%	3,180	10.3%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 51.7 percent to 57.6 percent during the AM peak hour along the cross street, with a peak direction of East throughout. During the PM peak hour the D factors ranged from 50.3 percent to 56.2 percent, with a westbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
University Parkway west of Cooper Creed	2,088	2,140	50.6%	53.1%	East
University Parkway east of Market Street	1,968	1,547	56.0%	56.5%	East
University Parkway west of I-75 SB Ramps	2,239	2,467	52.4%	51.7%	East
University Pkwy east of I-75 NB Ramps	2,943	2,117	58.2%	57.6%	East
University Pkwy east of Lake Osprey Drive	2,108	1,612	56.7%	56.7%	West
University Pkwy east of Town Center Pkwy	1,660	1,500	52.5%	52.3%	East

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
University Parkway west of Cooper Creed	2,357	2,401	50.5%	53.2%	West
University Parkway east of Market Street	1,711	1,908	52.7%	52.5%	West
University Parkway west of I-75 SB Ramps	2,577	2,911	53.0%	50.3%	West
University Pkwy east of I-75 NB Ramps	2,289	2,879	55.7%	56.2%	West
University Pkwy east of Lake Osprey Drive	1,811	2,178	54.6%	54.6%	West
University Pkwy east of Town Center Pkwy	1,693	1,487	53.2%	53.6%	East

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
University Parkway west of Cooper Creed	62,862	3,057	4.9%	1,071	1.7%	4,128	6.6%
University Parkway east of Market Street	39,197	1,774	4.5%	478	1.2%	2,252	5.7%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to University Parkway	137002	17000	-	16000	7.0	16500	7.1
I-75 Southbound On-Ramp from University Parkway	177092	19500	9.2	18000	9.7	19000	9.4
I-75 Northbound Off-Ramp to University Parkway	177091	19000	9.2	17500	9.7	18000	9.4
University Parkway, East of I-75	134019	33500	6.6	34000	5.5	35000	5.6
University Parkway, West of I-75	170061	47500	3.5	54500	5.7	54500	5.4

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	177091/177092	9.7%	4.85%
Cross Street	72-Hour Classification Count	6.6%	3.3%
Side Streets		6.6%	3.3%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eleven 72-hour bi-directional volume counts, and five turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & SR 780 Fruitville SB on Ramp	10,026	1.15	1	11,530	11,500
I-75 & SR 780 Fruitville SB loop on Ramp	3,848	1.15	1	4,425	4,400
I-75 & SR 780 Fruitville SB off Ramp	18,396	1.15	1	21,155	21,000
I-75 & SR 780 Fruitville NB off Ramp	11,337	1.15	1	13,038	13,000
I-75 & SR 780 Fruitville NB loop on Ramp	9,638	1.15	1	11,084	11,000
I-75 & SR 780 Fruitville NB on Ramp	3,875	1.15	1	4,456	4,500
Along Cross Street					
SR 780 Fruitville west of I-75 SB Ramps	59,465	1.15	N/A	68,385	68,500
SR 780 Fruitville east of I-75 NB Ramps	35,309	1.03	N/A	36,368	36,500
SR 780 Fruitville east of Coburn Rd East	24,387	1.15	1	28,045	28,000
SR 780 Fruitville west of Cattlemen Rd	54,163	1.15	1	62,287	62,500
Along Side Streets					
Lowe's Driveway south of SR 780	1,751	1.15	1	2,014	2,000
Cattlemen Rd south of SR 780 Fruitville	19,177	1.15	1	22,054	22,000
Cattlemen Rd north of SR 780 Fruitville	25,695	1.15	1	29,549	29,500

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured

at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the five intersections in the study area. During the AM peak hour, the PHF ranges from 0.96 to 0.98 with a weighted average of 0.96. During the PM peak hour, the PHF ranges from 0.89 to 0.95 with a weighted average of 0.92.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 780 Fruitville Road & Cattlemen Road	0.97	0.95
SR 780 Fruitville Road & I-75 SB Ramp Terminal	0.98	0.95
SR 780 Fruitville Road & I-75 NB Ramp Terminal	0.94	0.92
SR 780 Fruitville Road & Coburn Road (west)	0.97	0.89
SR 780 Fruitville Road & Coburn Road (east)	0.96	0.92
Average	0.96	0.92

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.7 percent. The weighted average of the PM PTD is 8.6 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & SR 780 Fruitville SB on Ramp	11,530	789	6.8%	1,204	10.4%
I-75 & SR 780 Fruitville SB loop on Ramp	4,425	458	10.4%	442	10.0%
I-75 & SR 780 Fruitville SB off Ramp	21,155	2,132	10.1%	1,425	6.7%
I-75 & SR 780 Fruitville NB off Ramp	13,038	1,742	13.4%	1,118	8.6%
I-75 & SR 780 Fruitville NB loop on Ramp	11,084	972	8.8%	1,371	12.4%
I-75 & SR 780 Fruitville NB on Ramp	4,456	458	10.3%	658	14.8%
Along Cross Street					
SR 780 Fruitville west of I-75 SB Ramps	68,385	4,965	7.3%	4,313	6.3%
SR 780 Fruitville east of I-75 NB Ramps	36,368	3,225	8.9%	3,237	8.9%
SR 780 Fruitville west of Cattlemen Rd	62,287	4,660	7.5%	4,958	8.0%
SR 780 Fruitville east of Coburn Rd East	28,045	2,850	10.2%	2,619	9.3%
Along Side Streets					
Lowe's Driveway south of SR 780	2,014	108	5.4%	130	6.5%
Cattlemen Rd south of SR 780 Fruitville	22,054	1,912	8.7%	2,068	9.4%
Cattlemen Rd north of SR 780 Fruitville	29,549	2,119	7.2%	2,564	8.7%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 50.4 percent to 60.3 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors ranged from 50.9 percent to 56.9 percent, with an eastbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 780 Fruitville west of I-75 SB Ramps	2,314	2,651	53.4%	60.3%	West
SR 780 Fruitville east of I-75 NB Ramps	1,676	1,549	52.0%	51.6%	West
SR 780 Fruitville west of Cattlemen Rd	2,050	2,610	56.0%	59.1%	West
SR 780 Fruitville east of Coburn Rd East	1,451	1,399	50.9%	50.4%	West
Along Side Streets					
Lowe's Driveway south of SR 780	48	60	55.6%	58.7%	South
Cattlemen Rd south of SR 780 Fruitville	942	970	50.7%	50.8%	North
Cattlemen Rd north of SR 780 Fruitville	1,233	886	58.2%	56.9%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 780 Fruitville west of I-75 SB Ramps	2,444	1,869	56.7%	55.0%	East
SR 780 Fruitville east of I-75 NB Ramps	1,508	1,729	53.4%	56.9%	East
SR 780 Fruitville west of Cattlemen Rd	2,665	2,293	53.8%	55.7%	East
SR 780 Fruitville east of Coburn Rd East	1,341	1,278	51.2%	50.9%	West
Along Side Streets					
Lowe's Driveway south of SR 780	56	74	56.9%	55.7%	North
Cattlemen Rd south of SR 780 Fruitville	1,194	874	57.7%	59.2%	South
Cattlemen Rd north of SR 780 Fruitville	1,507	1,057	58.8%	57.4%	South

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
SR 780 Fruitville west of I-75 SB Ramps	68,385	4,237	6.2%	915	1.3%	5,152	7.5%
SR 780 Fruitville east of I-75 NB Ramps	36,368	3,319	9.1%	313	0.9%	3,632	10.0%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to Fruitville Road	177086	22500	7.0%	17500	6.4%	18000	6.1%
I-75 Southbound loop On-Ramp from Fruitville Road	177084	3600	7.0%	3800	6.4%	4000	6.1%
I-75 Southbound On-Ramp from Fruitville Road	177082	11500	7.0%	10500	6.4%	11000	6.1%
I-75 Northbound Off-Ramp to Fruitville Road	177081	14500	7.0%	14000	6.4%	14500	6.1%

I-75 Northbound On-Ramp from Fruitville Road	177085	5800	7.0%	4500	6.4%	4700	6.1%
Cattlemen Road, South of Fruitville Road	174486	19700	4.6%	18600	6.4%	18600	6.4%
Fruitville Road, west of I-75	170021	50500	5.3%	51500	2.9%	53000	3.2%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T₂₄ and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	177086/177084/177082/177081	7.0%	4.0%
Cross Street	72-Hour Classification Count	10.0%	5.0%
Side Streets		10.0%	5.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, twelve 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & Bee Ridge Road SB on Ramp	8,758	1.13	0.96	9,501	9,500
I-75 & Bee Ridge Road SB off Ramp	13,748	1.13	0.96	14,914	15,000
I-75 & Bee Ridge Road NB off Ramp	8,919	1.13	0.96	9,675	9,700
I-75 & Bee Ridge Road NB loop on Ramp	9,089	1.13	0.96	9,860	9,900
I-75 & Bee Ridge Road NB on Ramp	3,796	1.13	0.96	4,118	4,100
Along Cross Street					
Bee Ridge Road west of Cattlemen Road	40,044	1.03	N/A	41,245	41,000
Bee Ridge Road east of I-75 NB Ramps	25,275	1.13	N/A	28,561	28,500
Bee Ridge Road west of Maxfield Drive	37,713	1.03	0.96	37,291	37,500
Bee Ridge Road west of I-75 SB Ramp	48,938	1.13	0.96	53,088	53,000
Bee Ridge Road east of Mauna Loa Blvd	17,753	1.13	0.96	19,258	19,500
Along Side Streets					
Driveway north of Bee Ridge Road	1,034	1.13	0.96	1,122	1,100
Cattlemen Road south of Bee Ridge Road	26,288	1.13	0.96	28,517	28,500
Cattlemen Road north of Bee Ridge Road	26,771	1.13	0.96	29,041	29,000
Mauna Loa Blvd south of Bee Ridge Rd	6,944	1.13	0.96	7,533	7,500

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study area. During the AM peak hour, the PHF ranges from 0.90 to 0.96 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.90 to 0.96 with a weighted average of 0.93.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Bee Ridge Road & Maxfield Drive	0.90	0.96
Bee Ridge Road & Cattlemen Road	0.96	0.93
Bee Ridge Road & I-75 Southbound Ramp Terminal	0.92	0.93
Bee Ridge Road & I-75 Northbound Ramp Terminal	0.92	0.94
Bee Ridge Road & Mauna Loa Boulevard	0.90	0.93
Cattlemen Road & Cattleridge Boulevard	0.92	0.90
Average	0.92	0.93

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.2 percent. The weighted average of the PM PTD is 8.4 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & Bee Ridge Road SB on Ramp	9,501	622	6.5%	976	10.3%

Mauna Loa Blvd south of Bee Ridge Rd	7,533	642	8.5%	696	9.2%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 57.7 percent to 63.0 percent during the AM peak hour along the cross street, with an eastbound peak direction east of I-75 and a westbound peak direction west of I-75. During the PM peak hour the D factors ranged from 53.3 percent to 56.8 percent along the cross street, with a westbound peak direction east of I-75 and an eastbound peak direction west of I-75.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Bee Ridge Road west of Maxfield Drive	1,195	1,515	55.9%	59.2%	West
Bee Ridge Road west of Cattlemen Road	1,261	1,764	58.3%	57.7%	East
Bee Ridge Road west of I-75 SB Ramp	1,637	2,927	64.1%	62.3%	West
Bee Ridge Road east of I-75 NB Ramps	990	1,628	62.2%	63.0%	East
Bee Ridge Road east of Mauna Loa Blvd	602	927	60.6%	60.4%	East
Along Side Streets					
Driveway north of Bee Ridge Road	59	35	62.8%	73.4%	North
Cattlemen Road south of Bee Ridge Road	961	970	50.2%	50.3%	South
Cattlemen Road north of Bee Ridge Road	1,411	930	60.3%	63.9%	South
Mauna Loa Blvd south of Bee Ridge Rd	475	167	74.0%	74.6%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Bee Ridge Road west of Maxfield Drive	1,555	1,412	52.4%	53.3%	East
Bee Ridge Road west of Cattlemen Road	1,741	1,468	54.3%	55.5%	West
Bee Ridge Road west of I-75 SB Ramp	2,353	2,036	53.6%	55.8%	East
Bee Ridge Road east of I-75 NB Ramps	1,562	1,261	55.3%	55.4%	West
Bee Ridge Road east of Mauna Loa Blvd	903	714	55.8%	56.8%	West
Along Side Streets					
Driveway north of Bee Ridge Road	36	37	50.7%	58.9%	North
Cattlemen Road south of Bee Ridge Road	990	1,258	56.0%	56.1%	North
Cattlemen Road north of Bee Ridge Road	1,012	1,353	57.2%	59.2%	North
Mauna Loa Blvd south of Bee Ridge Rd	260	436	62.6%	64.0%	North

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
Bee Ridge Road west of Cattlemen Road	41,245	1,674	4.1%	152	0.4%	1,826	4.4%
Bee Ridge Road east of I-75 NB Ramps	32,006	1,373	4.3%	78	0.2%	1,451	4.5%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to Bee Ridge Road	177074	16000	7.0%	13500	6.4%	14000	6.1%
I-75 Southbound On-Ramp from Bee Ridge Road	177072	9700	7.0%	8500	6.4%	8900	6.1%
I-75 Northbound Off-Ramp to Bee Ridge Road	177071	9700	7.0%	8500	6.4%	8900	6.1%
I-75 Northbound loop On-Ramp from Bee Ridge Road	177073	11500	7.0%	9400	6.4%	9800	6.1%

Bee Ridge Road

I-75 Northbound On-Ramp from Bee Ridge Road	177075	4300	7.0%	3600	6.4%	3800	6.1%
Bee Ridge Road, East of I-75	174112	26000	5.1%	25000	4.9%	27500	4.7%
Bee Ridge Road, West of I-75	175074	34000	4.1%	35000	4.1%	39500	3.9%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	177074/177072/177071/177073	7.0%	4.0%
Cross Street	72-Hour Classification Count	4.5%	3.0%
Side Streets		4.5%	3.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, seven 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & Clark Road NB off Ramp	7,441	1.13	0.99	8,324	8,300
I-75 & Clark Road SB on Ramp	7,481	1.13	0.99	8,369	8,400
I-75 & Clark Road NB on Ramp	15,638	1.13	0.99	17,494	17,500
I-75 & Clark Road SB off Ramp	16,113	1.13	0.99	18,026	18,000
Along Cross Street					
Clark Road west of I-75 SB Ramps	52,261	1.03	N/A	53,829	54,000
Clark Road east of I-75 NB Ramps	19,071	1.03	N/A	19,643	19,500
Clark Road west of Gantt Road	50,985	1.13	0.99	57,037	57,000
Clark Road west of Hummingbird Avenue	16,345	1.13	0.99	18,285	18,500
Clark Road east of Hummingbird Avenue	15,128	1.13	0.99	16,924	17,000

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study area. During the AM peak hour, the PHF ranges from 0.85 to 0.97 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.89 to 0.94 with a weighted average of 0.92.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 72 Clark Road & Gantt Road	0.96	0.93
SR 72 Clark Road & Catamaran Drive	0.96	0.93
SR 72 Clark Road & I-75 Southbound Ramp Terminal	0.93	0.94
SR 72 Clark Road & I-75 Northbound Ramp Terminal	0.97	0.93
SR 72 Clark Road & Queensbury Boulevard	0.84	0.92
SR 72 Clark Road & Hummingbird Avenue	0.85	0.89
Average	0.92	0.92

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.4 percent. The weighted average of the PM PTD is 8.3 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & Clark Road NB off Ramp	8,324	977	11.7%	553	6.6%
I-75 & Clark Road SB on Ramp	8,369	624	7.5%	863	10.3%
I-75 & Clark Road NB on Ramp	17,494	1,267	7.2%	1,492	8.5%
I-75 & Clark Road SB off Ramp	18,026	1,503	8.3%	1,377	7.6%
Along Cross Street					
Clark Road west of I-75 SB Ramps	53,829	4,268	7.9%	4,368	8.1%
Clark Road east of I-75 NB Ramps	19,643	1,716	8.7%	1,750	8.9%
Clark Road west of Gantt Road	57,037	4,462	7.8%	4,570	8.0%
Clark Road west of Hummingbird Avenue	18,285	1,696	9.3%	1,580	8.6%
Clark Road east of Hummingbird Avenue	16,924	1,577	9.3%	1,472	8.7%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 52.3 percent to 60.1 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors ranged from 58.7 percent to 62.9 percent along the cross street, with an eastbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Clark Road west of I-75 SB Ramps	1,820	2,448	57.4%	58.2%	West
Clark Road east of I-75 NB Ramps	787	929	54.1%	52.3%	West
Clark Road west of Gantt Road	1,711	2,751	61.7%	60.1%	West
Clark Road west of Hummingbird Avenue	776	920	54.2%	54.3%	West
Clark Road east of Hummingbird Avenue	740	837	53.1%	52.8%	West
Along Side Streets					

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Clark Road west of I-75 SB Ramps	2,530	1,838	57.9%	58.7%	East
Clark Road east of I-75 NB Ramps	1,047	703	59.8%	62.7%	East
Clark Road west of Gantt Road	2,576	1,994	56.4%	56.8%	East
Clark Road west of Hummingbird Avenue	987	593	62.5%	62.9%	East
Clark Road east of Hummingbird Avenue	920	552	62.5%	62.8%	East
Along Side Streets					

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceeded the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
Clark Road west of I-75 SB Ramps	54,003	3,467	6.4%	734	1.4%	4,201	7.8%
Clark Road east of I-75 NB Ramps	19,643	1,291	6.6%	87	0.4%	1,378	7.0%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to Clark Road	177064	18500	9.2%	17000	9.7%	17500	9.4%
I-75 Southbound On-Ramp from Clark Road	177062	8400	9.2%	7500	9.7%	7800	9.4%
I-75 Northbound Off-Ramp to Clark Road	177061	8300	9.2%	8000	9.7%	8300	9.4%
I-75 Northbound On-Ramp from Clark Road	177063	18000	9.2%	16000	9.7%	16500	9.4%
Clark Road, East of I-75	170024	11600	14.2%	11300	10.8%	10900	10.0%
Clark Road, West of I-75	170018	44000	4.5%	42500	3.8%	46500	5.2%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification

count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T₂₄ and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	177064/177062/177061/177063	9.7%	5.0%
Cross Street	72-Hour Classification Count	7.8%	4.0%
Side Streets		7.8%	4.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, two 72-hour bi-directional volume counts, and two turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>

SR - 681 & I-75	TMC

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
Along Cross Street					
SR 681 south of Honore Avenue	14,976	1.1	N/A	16,474	16,500
Along Side Streets					
Honore Avenue east of SR 681	4,566	1.1	0.91	4,571	4,600
Honore Avenue west of SR 681	6,418	1.1	0.91	6,424	6,400

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the SR 684 at Honore Avenue intersection in the study area. The PHFs are 0.93 for AM peak hour and 0.92 for PM peak hour.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 681 at Honore Ave	0.93	0.92
Average	0.93	0.92

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 9.1 percent. The weighted average of the PM PTD is 8.8 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
Along Cross Street					
SR 681 south of Honore Avenue	16,474	1,475	9.0%	1,422	8.6%
Along Side Streets					
Honore Avenue east of SR 681	4,571	420	9.2%	419	9.2%
Honore Avenue west of SR 681	6,424	593	9.2%	587	9.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor is 50.9 percent during the AM peak hour along the cross street, with a peak direction of south. During the PM peak hour the D factor is to 50.6 percent along the cross street, with a peak direction of south.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 681 south of Honore Avenue	737	738	50.0%	50.9%	South
Along Side Streets					
Honore Avenue east of SR 681	164	256	61.0%	59.7%	West
Honore Avenue west of SR 681	238	355	59.9%	61.7%	East

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
SR 681 south of Honore Avenue	707	715	50.3%	50.6%	South
Along Side Streets					
Honore Avenue east of SR 681	247	172	58.9%	58.8%	East
Honore Avenue west of SR 681	344	243	58.6%	57.8%	West

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
SR 681 south of Honore Avenue	16,473	1,123	6.8%	194	1.2%	1,317	8.0%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Northbound On-Ramp from SR 681	177051	15000	8.7%	15000	8.1%	15000	7.9%
I-75 Northbound Off-Ramp to SR 681	177052	7200	8.7%	7500	8.1%	7800	7.9%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	177051/177052	7.9%	4.0%
Cross Street	72-Hour Classification Count	8.0%	4.0%
Side Streets		8.0%	4.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eight 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>	
I-75 & Laurel Road Southbound on Ramp	72-Hour Volume Count
I-75 & Laurel Road Southbound off Ramp	72-Hour Volume Count
I-75 & Laurel Road Northbound off Ramp	72-Hour Volume Count
I-75 & Laurel Road Northbound on Ramp	72-Hour Volume Count

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & Laurel Road Southbound on Ramp	6,562	1.1	0.99	7,146	7,100
I-75 & Laurel Road Southbound off Ramp	5,057	1.1	0.99	5,507	5,500
I-75 & Laurel Road Northbound off Ramp	6,066	1.1	0.99	6,606	6,600
I-75 & Laurel Road Northbound on Ramp	4,778	1.1	0.99	5,203	5,200
Along Cross Street					
Laurel Road west of I-75 SB Ramps	21,324	1.03	N/A	21,964	22,000
Laurel Road east of I-75 NB Ramps	16,352	1.03	N/A	16,843	17,000
Laurel Road west of Pinebrook Road	14,804	1.1	0.99	16,122	16,000
Laurel Road east of Haul Road	5,022	1.1	0.99	5,469	5,500
Along Side Streets					
Pinebrook Road south of Laurel Road	9,536	1.1	0.99	10,385	10,500
Pinebrook Road north of Laurel Road	4,601	1.1	0.99	5,010	5,000

*This count was a vehicle classification count.

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the six intersections in the study area. During the AM peak hour, the PHF ranges from 0.87 to 0.96 with a weighted average of 0.93. During the PM peak hour, the PHF ranges from 0.88 to 0.94 with a weighted average of 0.91.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Laurel Road & Twin Laurel Boulevard	0.92	0.90
Laurel Road & Pinebrook Road	0.87	0.91
Laurel Road & I-75 Southbound Ramp Terminal	0.93	0.94
Laurel Road & I-75 Northbound Ramp Terminal	0.95	0.92
Laurel Road & Discovery Way	0.96	0.88
Laurel Road & Haul Road	0.92	0.90
Average	0.93	0.91

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.3 percent. The weighted average of the PM PTD is 8.8 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<i>I-75 Ramps</i>					
I-75 & Laurel Road Southbound on Ramp	7,146	401	5.6%	802	11.2%
I-75 & Laurel Road Southbound off Ramp	5,507	455	8.3%	463	8.4%
I-75 & Laurel Road Northbound off Ramp	6,606	824	12.5%	362	5.5%
I-75 & Laurel Road Northbound on Ramp	5,203	509	9.8%	461	8.9%
<i>Along Cross Street</i>					
Laurel Road west of I-75 SB Ramps	21,964	1,998	9.1%	2,072	9.4%
Laurel Road east of I-75 NB Ramps	16,843	1,389	8.2%	1,454	8.6%
Laurel Road west of Pinebrook Road	16,122	1,365	8.5%	1,311	8.1%
Laurel Road east of Haul Road	5,469	399	7.3%	411	7.5%
<i>Along Side Streets</i>					
Pinebrook Road south of Laurel Road	10,385	928	8.9%	913	8.8%
Pinebrook Road north of Laurel Road	5,010	466	9.3%	452	9.0%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 55.5 percent to 70.7 percent during the AM peak hour along the cross street, with an eastbound peak direction east of I-75 and a westbound peak direction west of I-75. During the PM peak hour the D factors ranged from 50.4 percent to 64.4 percent along the cross street, with a westbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Laurel Road west of I-75 SB Ramps	908	1,090	54.6%	55.5%	West
Laurel Road east of I-75 NB Ramps	776	613	55.9%	58.1%	East
Laurel Road west of Pinebrook Road	556	809	59.3%	60.7%	West
Laurel Road east of Haul Road	119	280	70.2%	70.7%	East
Along Side Streets					
Pinebrook Road south of Laurel Road	508	420	54.7%	54.9%	South
Pinebrook Road north of Laurel Road	281	185	60.3%	60.8%	North

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Laurel Road west of I-75 SB Ramps	1,042	1,030	50.3%	50.4%	West
Laurel Road east of I-75 NB Ramps	494	960	66.0%	64.4%	West
Laurel Road west of Pinebrook Road	691	620	52.7%	53.1%	East
Laurel Road east of Haul Road	232	179	56.4%	56.4%	West
Along Side Streets					
Pinebrook Road south of Laurel Road	345	568	62.2%	62.8%	North
Pinebrook Road north of Laurel Road	177	275	60.8%	60.7%	South

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
Laurel Road west of I-75 SB Ramps	24,296	1,892	7.8%	138	0.6%	2,030	8.4%
Laurel Road east of I-75 NB Ramps	18,439	2,064	11.2%	485	2.6%	2,549	13.8%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T₂₄ Factors

Location	COSITE	2017		2018		2019	
		AADT	T ₂₄	AADT	T ₂₄	AADT	T ₂₄
I-75 Southbound On-Ramp to Laurel Rd	177042	6400	7.0%	6300	6.4%	6600	6.1%
I-75 Northbound On-Ramp from Laurel Rd	177043	5600	7.0%	5300	6.4%	5500	6.1%
I-75 Northbound Off-Ramp to Laurel Rd	177041	6500	7.0%	5900	6.4%	6200	6.1%
I-75 Southbound Off-Ramp to Laurel Rd	177044	5800	7.0%	5300	6.4%	5500	6.1%
Laurel Road, West of I-75	174279	15600	4.3%	20500	8.7%	21500	6.8%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T₂₄ and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T ₂₄	DHT
I-75 Ramps	177042/177043/177041	7.0%	4.0%
Cross Street	72-Hour Classification Count	13.8%	7.0%
Side Streets		13.8%	7.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, eight 72-hour bi-directional volume counts, and five turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & Jacaranda Blvd SB off Ramp	9,130	1.08	0.92	9,072	9,100
I-75 & Jacaranda Blvd SB on Ramp	5,803	1.08	0.92	5,766	5,800
I-75 & Jacaranda Blvd NB on Ramp	785	1.08	0.92	780	800
I-75 & Jacaranda Blvd NB loop on Ramp	8,028	1.08	0.92	7,977	8,000
I-75 & Jacaranda Blvd NB off Ramp	5,665	1.08	0.92	5,629	5,600
Along Cross Street					
Jacaranda Blvd south of I-75 SB Ramps	32,951	1.03	N/A	33,940	34,000
Jacaranda Blvd north of I-75 NB Ramps	9,546	1.08	N/A	10,310	10,500
Jacaranda Blvd south of Oak Heritage Drive	32,368	1.03	0.93	31,005	31,000
Jacaranda Blvd south of Executive Drive	29,616	1.08	0.92	29,426	29,500
Jacaranda Boulevard north of Commerce Drive	5,877	1.08	0.92	5,839	5,800

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the five intersections in the study area. During the AM peak hour, the PHF ranges from 0.93 to 0.98 with a weighted average of 0.95. During the PM peak hour, the PHF ranges from 0.80 to 0.93 with a weighted average of 0.86.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Jacaranda Boulevard & Oak Heritage Drive	0.93	0.93
Jacaranda Boulevard & Executive Drive	0.97	0.93
Jacaranda Boulevard & I-75 Southbound Ramp Terminal	0.98	0.90
Jacaranda Boulevard & I-75 Northbound Ramp Terminal	0.94	0.80
Jacaranda Boulevard & Commerce Drive	0.93	0.72
Average	0.95	0.86

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.7 percent. The weighted average of the PM PTD is 8.6 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & Jacaranda Blvd SB off Ramp	9,072	693	7.6%	859	9.5%
I-75 & Jacaranda Blvd SB on Ramp	5,766	311	5.4%	771	13.4%
I-75 & Jacaranda Blvd NB on Ramp	780	83	10.6%	75	9.6%
I-75 & Jacaranda Blvd NB loop on Ramp	7,977	815	10.2%	559	7.0%
I-75 & Jacaranda Blvd NB off Ramp	5,629	735	13.1%	325	5.8%
Along Cross Street					
Jacaranda Blvd south of I-75 SB Ramps	33,940	2,923	8.6%	2,809	8.3%
Jacaranda Blvd north of I-75 NB Ramps	10,310	1,014	9.8%	771	7.5%
Jacaranda Blvd south of Oak Heritage Drive	31,005	2,464	7.9%	2,621	8.5%
Jacaranda Blvd south of Executive Drive	29,426	2,424	8.2%	2,506	8.5%
Jacaranda Boulevard north of Commerce Drive	5,839	456	7.8%	450	7.7%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 50.8 percent to 60.9 percent during the AM peak hour along the cross street, with a peak direction of south throughout. During the PM peak hour the D factors ranged from 50.4 percent to 63.9 percent the cross street, with a northbound peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Jacaranda Blvd south of I-75 SB Ramps	1,441	1,482	50.7%	50.8%	South
Jacaranda Blvd north of I-75 NB Ramps	676	338	66.7%	60.9%	South
Jacaranda Blvd south of Oak Heritage Drive	1,258	1,206	51.1%	51.2%	North
Jacaranda Blvd south of Executive Drive	1,226	1,198	50.6%	50.8%	South
Jacaranda Boulevard north of Commerce Drive	247	209	54.2%	53.7%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
Jacaranda Blvd south of I-75 SB Ramps	1,530	1,279	54.5%	50.4%	North
Jacaranda Blvd north of I-75 NB Ramps	266	505	65.5%	63.9%	North
Jacaranda Blvd south of Oak Heritage Drive	1,273	1,348	51.4%	51.4%	South
Jacaranda Blvd south of Executive Drive	1,184	1,322	52.8%	52.0%	North
Jacaranda Boulevard north of Commerce Drive	210	240	53.3%	51.5%	North

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
Jacaranda Blvd south of I-75 SB Ramps	33,939	2,163	6.4%	307	0.9%	2,470	7.3%
Jacaranda Blvd north of I-75 NB Ramps	10,310	917	8.9%	73	0.7%	990	9.6%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to Jacaranda Blvd	177034	10000	7.0%	9300	6.4%	9700	6.1%
I-75 Southbound On-Ramp from Jacaranda Blvd	177032	5200	7.0%	5600	6.4%	5800	6.1%
I-75 Northbound Off-Ramp to Jacaranda Blvd	177031	5400	7.0%	5700	6.4%	5900	6.1%
I-75 Northbound On-Ramp from Jacaranda Blvd	177033	9600	7.0%	8800	6.4%	9200	6.1%
Jacaranda Blvd, South of I-75	174400	29000	3.2%	30500	3.4%	30500	3.6%
Jacaranda Blvd, North of I-75	174537	4600	3.2%	5700	7.3%	5700	7.3%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	177034/177032/177031	7.0%	4.0%
Cross Street	72-Hour Classification Count	9.6%	5.0%
Side Streets		9.6%	5.0%

Note: Assume side street truck percentage is equal to cross street truck percentage

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during August through December 2019. There were two 72-hour bi-directional classification counts, four 72-hour bi-directional volume counts, and four turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

Table 1.1: Traffic Data Collection

Location	Type of Count
<i>I-75 Ramps</i>	
I-75 & River Road Southbound off Ramp	72-Hour Volume Count
I-75 & River Road Southbound on Ramp	72-Hour Volume Count
I-75 & River Road Northbound off Ramp	72-Hour Volume Count
I-75 & River Road Northbound on Ramp	72-Hour Volume Count
<i>Along Cross Street</i>	
River Road south of I-75 SB Ramps	72-Hour Classification Count
River Road south of Venice Avenue	72-Hour Classification Count
<i>Intersections</i>	
River Road & Venice Avenue	TMC
River Road & subdivision entrance	TMC
River Road & I-75 Southbound Ramp Terminal	TMC
River Road & I-75 Northbound Ramp Terminal	TMC

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Ramps					
I-75 & River Road Southbound off Ramp	7,491	1.08	0.99	8,009	8,000
I-75 & River Road Southbound on Ramp	1,819	1.08	0.99	1,945	1,900
I-75 & River Road Northbound off Ramp	1,782	1.08	0.99	1,905	1,900
I-75 & River Road Northbound on Ramp	7,574	1.08	0.99	8,098	8,100
Along Cross Street					
River Road south of I-75 SB Ramps	18,242	1.08	N/A	19,701	19,500
River Road south of Venice Avenue	21,062	1.08	0.99	22,519	22,500

**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the four intersections in the study area. During the AM peak hour, the PHF ranges from 0.84 to 0.94 with a weighted average of 0.90. During the PM peak hour, the PHF ranges from 0.88 to 0.93 with a weighted average of 0.91.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
River Road & Venice Avenue	0.92	0.93
River Road & subdivision entrance	0.94	0.88
River Road & I-75 Southbound Ramp Terminal	0.89	0.90
River Road & I-75 Northbound Ramp Terminal	0.84	0.92
Average	0.90	0.91

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 9.2 percent. The weighted average of the PM PTD is 8.6 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Ramps					
I-75 & River Road Southbound off Ramp	8,009	539	6.7%	799	10.0%
I-75 & River Road Southbound on Ramp	1,945	163	8.4%	238	12.2%
I-75 & River Road Northbound off Ramp	1,905	227	11.9%	112	5.9%
I-75 & River Road Northbound on Ramp	8,098	908	11.2%	480	5.9%
Along Cross Street					
River Road south of I-75 SB Ramps	19,701	1,785	9.1%	1,678	8.5%
River Road south of Venice Avenue	22,519	1,958	8.7%	1,901	8.4%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 58.8 percent to 61.8 percent during the AM peak hour along the cross street, with a northbound peak direction north of Venice avenue and a southbound peak direction south of Venice avenue. During the PM peak hour the D factors ranged from 57.1 percent to 59.8 percent the cross street, with a southbound peak direction north of Venice avenue and a northbound peak direction south of Venice avenue.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
River Road south of I-75 SB Ramps	1,051	734	58.9%	58.8%	North
River Road south of Venice Avenue	1,190	768	60.8%	61.8%	South

*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
Along Cross Street					
River Road south of I-75 SB Ramps	724	954	56.9%	57.1%	South
River Road south of Venice Avenue	783	1,118	58.8%	59.8%	North

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during August through December 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})	
		Count	%	Count	%	Count	%
River Road south of I-75 SB Ramps	19,702	1,645	8.3%	423	2.1%	2,068	10.5%

Table 2.7 summarizes the historical AADT and T_{24} factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T_{24} Factors

Location	COSITE	2017		2018		2019	
		AADT	T_{24}	AADT	T_{24}	AADT	T_{24}
I-75 Southbound Off-Ramp to River Road	177024	7300	7.0%	7500	6.4%	7800	6.1%
I-75 Southbound On-Ramp from River Road	177022	1500	7.0%	1600	6.4%	1700	6.1%
I-75 Northbound Off-Ramp to River Road	177021	1500	7.0%	1600	6.4%	1700	6.1%
I-75 Northbound On-Ramp from River Road	177023	7600	7.0%	7600	6.4%	7900	6.1%

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 Ramps	177024/177022/177021/177023	7.0%	4.0%
Cross Street	72-Hour Classification Count	10.5%	6.0%
Side Streets		10.5%	6.0%

Note: Assume side street truck percentage is equal to cross street truck percentage
